16. ABSTRACT

Samples of mother's milk were collected from Bayonne, NJ; Jersey City, NJ; Pittsburgh, PA; Baton Rouge, LA; and Charleston, WV, and analyzed for volatile (purgeables) and semivolatile (extractable) organics using glass capillary gas chromatography/mass spectrometry/computer. In the volatile fraction, 26 halogenated hydrocarbons, 17 aldehydes, 20 ketones, 11 alcohols, 2 acids, 3 ethers, 1 epoxide, 14 furans, 26 other oxygenated compounds, 4 sulfur-containing compounds, 7 nitrogen-containing compounds, 13 alkanes, 12 alkenes, 7 alkynes, 11 cyclic hydrocarbons, and 15 aromatics were found, including major peaks for hexanal, limonene, dichlorobenzene, and some esters. The levels of dichlorobenzene appeared to be significantly higher in the samples from Jersey City and Bayonne than in samples from other sites. Jersey City samples also appeared to have significantly higher levels of tetrachloroethylene. Charleston and Jersey City samples appeared to have significantly higher levels of chloroform; however, chloroform was observed in the blanks at about 20% of that in the samples. Due to the small sample size and lack of control over the solicitation of sample donors, the data cannot be used to extrapolate to the general population.

Fewer semivolatile compounds of interest were found. Polychlorinated naphthalenes, polybrominated biphenyls, chlorinated phenols, and other compounds were specifically sought and not detected (limit of detection about 20-100 ng/mL milk). Polychlorinated biphenyls (PCBs) and DDE were found.

ACKNOWLEDGMENTS

The authors thank the Project Officer, Dr. Joseph Breen, for his guidance and advice. Sandra P. Parks, David L. Newton, and Larry C. Michael are acknowledged for their assistance in the laboratory. Nora P. Castillo and Kent W. Thomas are thanked for their assistance with mass spectral interpretation. Pamela A. Gentry, Fred A. McKinney, Stephen P. Burke, and Barbara L. Bickford are thanked for sample analysis using mass spectrometry.

Personnel who assisted in the milk collection are greatly appreciated: Elizabeth Bartholomew, Bayonne Hospital, Bayonne, NJ; Jules Rivkind and Trudy Strunk, Medical Center Hospital, Jersey City, NJ; Ian Holtzman, Magee-Women's Hospital, Pittsburgh, PA; Lewis Trachtman, Louisiana Health Department, New Orleans, LA; Maxine Parker, Baton Rouge Area Regional Nursing Consultant, Baton Rouge, LA; Clementine Martine, Public Health Nursing Supervisor of the East Baton Rouge Parish Health Unit, Baton Rouge, LA; and N. N. Sehgal, Charleston Area Medical Center (Memorial Division), Charleston, WV.

Finally we would like to thank the 42 women who so kindly donated the samples.

SECTION 1
INTRODUCTION

BACKGROUND

It is becoming increasingly important to correlate ambient environmental pollutant levels with human body burden. Establishment of this correlation ("exposure assessment") may provide a link between pollution and health effects. This correlation is of interest for both scientific research and regulatory risk assessment.

Measurement of pollutant body burden levels generally requires invasive techniques (exceptions are breath and urine sampling) which are undesirable from the subjects' viewpoint. Some invasive techniques are generally regarded as acceptable (e.g., blood samples), while others are generally considered unacceptable from living donors (e.g. adipose tissue, internal organs, etc.). Mother's milk is an attractive medium for several reasons: (1) sample collection is reasonably straightforward; (2) milk contains a high amount of fat (about 3.5 percent, as shown in see Table 1), so fat-soluble pollutants such as DDT and polychlorinated biphenyls (PCBs) are likely to be found in higher concentrations in milk than in blood or urine; (3) large (50-100 mL) volumes are easily collected for analysis, increasing analytical reliability and detection limit; and (4) the population of nursing mothers is large relative to pathology samples such as adipose tissue. In addition, an assessment of pollutant concentrations in mother's milk may be used to predict the pollutant intake by the nursing infant.

The major disadvantages of mother's milk as a human-sampling medium relate to the sampling demography: only young-to-middle-aged females are nursing. Thus, any use of mother's milk in a probability-based sampling framework extrapolated to the general population would be fraught with difficulties, such as locating donors.

Table 1. COMPARISON BETWEEN HUMAN AND COW'S MILK[1]

Parameter	Human Milk	Cow's Milk
Water and solid content	Same in both; 87 to 87.5 percent is water	
Calories	Same in both; 20 calories per ounce	
Protein	1 to 1.5 percent; 60 percent of this is lactalbumin and 40 percent casein	3.5 percent; 15 percent of this is lactalbumin and 85 percent casein
Carbohydrate (in form of lactose)	6.5 to 7.5 percent	4.5 to 5.0 percent
Fat(s)	Variable, but both have approximately 3.5 percent. (Differs qualitatively)	
	Contains more olein, which is is readily adsorbed	Contains more volatile fatty acids, which are irritating to the gastric mucosa
	Digestion of fat easy	Digestion of fat sometimes difficult
Minerals	0.15 to 0.25 percent	0.7 to 0.75 percent. Contains more of all minerals with the exception of iron and copper
	Iron content is low in both milks, approximately:	
	1.5 mg/l	0.5 mg/l
Vitamins	Varies with maternal intake	

(continued)

Table 1 (cont'd.)

Parameter	Human Milk	Cow's Milk
Vitamin A	Relative large amounts in both milks	
Vitamin B	Probably adequate in both milks	
Vitamin C	More is found in human milk	
Thiamine	Higher content in cow's milk	
Riboflavin	Higher content in cow's milk	
Vitamin D	Relatively small amount in both milks	
Vitamin E	Satisfactory level in breath milk	
Digestion	Cow's milk has a higher buffer content and can therefore adsorb much more gastric acid than breast milk before it reaches the acidity necessary for digestion. The large amount of casein on cow's milk make large, tough curds in the stomach as compared with the fine, easily broken down curds of breast milk	

The purpose of this study was to measure levels of environmental pollutants in human milk by gas chromatography/mass spectrometry (GC/MS) and to evaluate the utility of using this body fluid in specific pollutant studies for populations in the vicinity of chemical manufacturing plants and/or industrial user facilities. All routes of exposure, i.e., air, water, particulate, clothing and food were of interest. Mother's milk samples were acquired and analyzed for selected industrial chemicals. The chemicals of interest included: polychlorinated naphthalenes (PCNs), tetrachloroethylene, trichloroethane, dichloropropanes, benzene, polybrominated biphenyls (PBBs), chlorinated phenols, toluene, chlorinated benzenes, and chloroform.

Where possible, any other chemicals found in the extracts were identified and quantitated. The levels of selected organic compounds in mother's milk were investigated to assess the possibility of using this medium as an indicator of body burden for a wide range of organic compounds. For this feasibility study, no attempts were made to develop a statistically valid sample; sites were selected as having a high probability of pollutant detection and subjects were selected on a volunteer basis.

LITERATURE REVIEW

A review of the literature concerning pollutants in mother's milk was conducted. A computer search of MEDLARS II and ORBIT--III yielded 108 citations. These citations, plus personal contacts and manual searches yielded the data discussed below.

By far, most of the literature on environmental pollutants in mother's milk deals with chlorinated insecticides (e.g. DDT). PCBs have also been studied. Only a few references discuss the presence of other compounds in milk.

Table 2 lists the levels of pollutants found in mother's milk in the United States. Table 3 summarizes these findings. Table 4 summarizes pollutants found in mother's milk outside the United States. With the exception of one reference[27] regarding 1,2-dichloroethane exposure, all of the compounds found in mother's milk are semivolatile (extractable) halogenated compounds.

NOTES:

BHC = benzenehexachloride (hexachlorocyclohexane)
DDD = 2,2-bis(chlorophenyl)-1,1-dichloroethane
DDE = 1,1-dichloro-2,2-bis(chlorophenyl)ethylene
DDT = 1,1,1-trichloro-2,2-bis(chlorophenyl)ethane
Total DDT equiv. = sum of all DDT-related peaks calculated as if all were DDT.
PCB = polychlorinated biphenyls. Quantitation generally based on comparison to an Aroclor mixture.
HCB = hexachlorobenzene
ND = not detected.

Mean values were taken from original citation where available; otherwise arithmetic mean was calculated, counting "ND" values as zero and "T" values as 0.5 times the lowest reported value.

[a]Missing values indicate no data in original article.
[a]Lowest value not reported.

The literature shows that mother's milk often contains semivolatile chlorinated organic pollutants (pesticides). Presumably due to lack of analytical techniques and/or sensitivity, the presence of other pollutants has apparently not been investigated.

SECTION 2
SUMMARY AND CONCLUSIONS

The results show that sampling and analysis for organic compounds in mother's milk is feasible. The sample collection technique presented no significant problems. Analysis of the samples was generally satisfactory.

The use of purge and trap with gas chromatography/mass spectrometry/computer (GC/MS/COMP) analysis for volatile organics was successful, although the intrusion of contaminants during analysis presented problems with some compounds. The wide range of volatile compounds found includes common air and water pollutants and possible metabolites. Thus, it may be possible to use mother's milk as an indicator of body burden if a correlation between exposure and mother's milk concentration is established.

The extraction and GC/MS analysis for semivolatile organics was only marginally successful due to limited sensitivity (about 20-100 ppb milk). PCBs and DDE were the only halogenated semivolatiles found. The target semivolatile compounds (PCNs, PBBs, chlorinated phenols, and the higher chlorinated benzenes) were not present in quantities detectable by the survey techniques. The use of more sensitive (generally a factor of 100-1000) and selective methods [GC/electron capture detection (ECD), GC/negative ion chemical ionization mass spectrometry (NICIMS) or GC/single ion monitoring MS] may detect these compounds, but was outside the scope of this project.

SECTION 3
RECOMMENDATIONS

Further studies of the applicability of mother's milk as a matrix for assessing the human body burden of pollutants must directly compare human milk with the other available sample matrices. For example, comparison of the volatiles in breath, blood, urine, and mother's milk would determine which matrices are most suitable for measuring these compounds. It may also be advisable to use animal studies to determine the extent of environmental exposure-body burden correlation.

In addition, the effects of transport of pollutants to a newborn infant should be studied. Infants may be uniquely affected by some pollutants due to their small body weight and different metabolism relative to adults.

The measurement of semivolatile organics in mother's milk requires more sensitive techniques than those used in this study. For example, chlorinated compounds could best be detected using GC/ECD or GC/negative ion chemical ionization mass spectrometry and polynuclear aromatics by GC/photoionization detection.

Improvement in analytical methodology could occur at several points:

(1) As discussed above, more sensitive, analytical procedures could be used for specific compound classes.

(2) For volatile organics, background levels could be reduced with an on-line purge and trap/GC system.

Potential improvements in survey and sampling methodology include:

(1) Addition of questions regarding length of nursing, age of infant, time since last nursing, etc.

(2) Selection of participants according to a more statistically valid method (e.g. statistically random sampling).

(3) Closer control over physical collection methodologies (e.g. all respondents gathered at one location).

The 5-month time lag in the study awaiting OMB clearance was seriously detrimental to the project. The personnel and apparatus used for the validation studies had to be reassembled once OMB clearance was obtained. Restarting a project following a long dormant period requires retraining analytical personnel (or training new personnel if original personnel have been reassigned to other research projects), recalibration of instruments, and assembling the necessary laboratory apparatus and supplies, all of which consume government resources. Reducing this time lag is extremely important for execution of programs involving human testing.

SECTION 4
SELECTION OF SAMPLING SITES

Five urban areas were chosen as sampling sites. Each of these cities is a high-probability area for the presence of one or more of the chemicals of interest in mother's milk. Since many of the compounds of interest are probably specific to certain industrial sites, the samples from the other sites were intended to serve as controls for the site-specific compounds. Other compounds are considered ubiquitous and their levels in milk was probably not related to local industrial activity. The rationale for selecting the five sampling sites is discussed below.

BRIDGEVILLE, PENNSYLVANIA

PCNs are manufactured by Koppers Company, Inc., of Pittsburgh, PA, at the Koppers Chemical and Coatings plant in Bridgeville, about 10 km SW of Pittsburgh.[29] Reported production levels were 7 million lb in 1956 and 5 million lb in 1972,[29] indicating a potential long-term, relatively constant, exposure level in the surrounding area. Results from environmental monitoring in the area immediately (< 1 km) surrounding the plant indicated higher levels of PCNs in air and soil than those found near five PCN user sites, as shown in Table 5.[30-34] Furthermore, fish and apple samples from the same area were found to contain PCNs, indicating a potential link to the human food chain.

In addition to PCNs, plants in the Bridgeville area have been reported to emit large quantities of phthalic anhydride particulate.[35] At this plant site, Koppers is reported to manufacture chlorinated naphthalenes, phthalic anhydride, maleic anhydride, and alkyd resins.[36]

Table 5. SUMMARY OF PCN CONCENTRATIONS FOUND NEAR MANUFACTURING AND USE SITES[32]

Site	Sampling Period	Air, ng/m^3			Water, µg/L		Soil, µg/kg		
		Low	High	Mean	Up-stream	Down-stream	Low	High	Mean
PCN manufacturer (Koppers)	1	25	450	150	0.2	1.4	130	2300	940

NORTHERN NEW JERSEY - STATEN ISLAND, NEW YORK, AREA (NNJ)

The Northern New Jersey (NNJ) area was selected as a sampling site on two bases: production of PBBs and general chemical industrial activity.

Three facilities are of interest[37] with respect to PBBs: White Chemical Co., E 22nd St., Bayonne, NJ; Marcor, Inc., Standard T. Chemical Co., subsidiary, 2500 Richmond Terrace, Staten Island, NY; and Hexcel Corp., Fine Organics Division, 880 Main St., Sayreville, NJ. White produced 45,000 kg of PBBs (specifically octabromobiphenyl and decabromobiphenyl) between 1970 and 1973.[38] Hexcel is reported[39] to have produced unspecified amounts of decabromobiphenyl [as well as to have produced or used decabromobiphenyl oxide, ethylene dichloride, and 1,2-bis(2,4,6-tribromophenoxy)ethane]. Standard T is thought to have been a PBB user up to about 1974.[39]

Results of environmental sampling in the area surrounding these three companies[40,41] indicated the presence of PBBs, especially the more highly brominated homologs, in sediment, water, soil, human hair, fish, turtle, and plant matter. The findings in human hair oil (18 total samples), which ranged from undetectable to 310 ppm, are especially relevant to this study, since they indicate that the PBB manufacturing in this area and the resultant environmental contamination has resulted in human exposure.

Northern New Jersey has a high concentration of chemical industries,[42] many of which use or produce halogenated hydrocarbons. The list of industries and locations are summarized below. Coastal Industries, Inc. (swimming pool chemicals), Diamond Shamrock (textile processing chemicals), Scientific Chemical Processing (chemical waste disposal) and Tenneco Chemicals (synthetic foam rubbers) are located in Carlstadt. Crompton & Knowles Corp. (dyes, colors and chemicals) are located in Fairlawn. Fisher Scientific (chemicals), Conoco Chemicals are in Saddle Brook. In Bayonne are CIBA-Geigy (dyes and intermediates) and ICI America (organics). In Jersey City are Mallinkrodt (analytical reagents) and Onya Chemical Co. (textile finish compounds, water repellants, germicides, and detergents). In Kearney are Standard Chlorine Chemical Co. (chlorobenzenes), Theobald Industries (bleaches), PPG Industries (paint) and Monsanto (industrial chemicals). In South Kearney is BASF-Wyandotte (dyestuffs and vinylidine chloride). In Newark are American Oil and Supply Co. (surfactants and chemicals), Celanese Plastics (plastics),

DuPont (pigments), Inmont (paint), Maas & Waldstein (paint), Otto B. May (dyes, surfactants), 3M (chemicals), Benjamin Moore (paint), Sherwin-Williams (paint) and Vulcan Materials (chloromethanes). In Elizabeth are Perk (chlorinated solvents) and Speciality Chemicals Division of Allied Chemical Corp. Linden Chlorine Products (chlorine) is in Linden. In Rahway are M & T Chemicals (speciality chemicals) and Merck and Co. (industrial chemicals). In Edison are Cary Page Chemicals (PVC compounds) and Mobile Chemical (paint). In Parlin, Hercules manufactures chloroform. In Passaic are Pantasote Co. of New York (PVC resin film), Stauffer (vinyl sheet and film) and United Wool Piece Dyeing and Finishing (dyes). In Patterson are several dye manufacturers. In Wayne are American Cyanamid (chemicals) and Owens Illinois (plastics). Many of these and other firms in NNJ undoubtedly manufacture or use compounds which are of interest to this study.

The levels of general organic pollutants in NNJ have been found to be high due to intense chemical manufacturing in the area. Environmental monitoring by RTI under separate contracts,[43-46] has found a wide variety of organic pollutants in this area. In addition, preliminary results from ground and surface water samples indicate measurable levels of a number of volatile halogenated hydrocarbons.[44,45] These data, summarized in Table 6, are indicative of environmental levels of organics in the NNJ area to which humans may be exposed and thus are indicative of the types of compounds anticipated in mother's milk. Under a separate research project,[45] the daily intake of some selected organics was roughly estimated. These estimates are given in Tables 7 and 8. Clearly there is ample exposure to pollutants which could potentially partition into milk.

The statistics for cancer in two counties of NNJ are very high.[58,59] The overall rate for all malignant neoplasms is significantly above the national average. This cancer incidence in New Jersey has been partially linked to the chemical and allied industries located there.[60-64]

Northern New Jersey is a metropolitan area with a relatively static population, a well-established chemical industry, known environmental levels of organics (including PBBs) and abnormally high cancer rates. These factors make this area especially suited to this study of organics in mother's milk.

BATON ROUGE, LOUISIANA

Baton Rouge was selected on the basis of extensive organic chemical production (especially volatile halogenated hydrocarbons) as summarized in Table 9.[43] In addition, RTI has collected and analyzed ambient air samples from this area and established the presence of a number of compounds of interest in ambient air.[43] A summary of the levels of halogenated compounds found in water and air is presented in Table 10.

In addition to the industrial production in Baton Rouge, industries in Plaquemine (15 km SSW), St. Gabriel (20 km SSE) and Geismar (27 km SSE) may emit significant levels of chemicals which may contribute to the levels observed in mother's milk in Baton Rouge. These industries and their production are listed in Table 11.[36]

KANAWHA VALLEY, WEST VIRGINIA

Many manufacturers of organic chemicals are located in the Kanawha Valley, WV. DuPont, near Belle, WV, has a large chemical complex for the synthesis of substances such as methylmethacrylate, methylamines, ammonia, hydrogen cyanide, herbicides, and insecticides. In South Charleston are production and consumption plants (Union Carbide, and FMC). Plastics, PVC, antifreeze, chlorine, halogenated organics, carbon disulfide, peroxides, etc., are the predominant chemicals produced here. The major industrial facility in the town of Institute is Union Carbide, which also processes a broad spectrum of compounds, e.g., viscose rayon and phthalate esters. There is also a large-scale olefin processing complex and a rubber accelerator plant. A major terminal loading facility in South Charleston handles large quantities of a variety of organic compounds. Monsanto, FMC, Allied, and Fike have plants near Nitro for the production of antioxidants, rubber accelerators, industrial chemicals, and other materials. Several other chemical manufacturers, consumers, and transporters are located in the Kanawha Valley, some or all of which may contribute to the presence of organic materials in the ambient air or water and thus contribute to human exposure.

Previous RTI sampling[43,46,65,66] in the Kanawha Valley found a broad range of halogenated, ketone, aldehyde, ester, aromatic, and aliphatic compounds. Quantitative results included high values in air of 11,000 ng/m^3

for methylene chloride, 1500 ng/m^3 for tetrachloroethylene, and 72,000 ng/m^3 for benzene. Compounds identified in the air particulate fraction included long-chain alkanes, polycyclic aromatic hydrocarbons (PAH) from naphthalene through anthanthrene (or an isomer), alkyl-PAH derivatives, and nitrogen-containing heterocycles.

SECTION 5
SAMPLE COLLECTION

At each of the five sites, arrangements were made to work through clinical facilities to recruit a suitable panel of respondents. These facilities included the Bayonne Hospital in Bayonne, NJ; the Medical Center Hospital in Jersey City, NJ; Magee-Women's Hospital in Pittsburgh, PA; Charleston Area Medical Center in Charleston, WV; and the East Baton Rouge Parish Health Clinic in Baton Rouge, LA.

Advance arrangements were made through a contact person at each facility. This person was responsible for recruiting a professional member of the facility's staff to serve as the data collector. The data collector was usually a registered, licensed practical, or public health nurse associated with the facility.

Respondents were paid $5 for their assistance in providing a milk sample and completing the survey questionnaire.

The data collection effort is discussed in the following sections.

OMB CLEARANCE

Under the Federal Reports Act, clearance for the study of human subjects must be obtained from the Office of Management and Budget. This clearance was obtained on October 18, 1978. The OMB number is 158-578010. This study was approved with the understanding that: (1) the surveys were conducted as a pretest of the feasibility of information collection procedures; (2) the information collected will not be used to generalize to either local areas or the nation as a whole. These two caveats were invoked since the sample size was small and a nonprobability sampling method (subject selection) was used.

TRAINING

Before data collection began at a site, a training session was held to acquaint the facility contact person and data collector(s) with the survey. The session addressed the study objectives; use of the data collection instruments; administrative instructions; quality control procedures; and instructions for collecting, packing, and shipping milk samples to RTI. The training was conducted by an RTI survey specialist from the Survey Operations Center. A detailed manual and necessary field reporting forms were developed for use in these sessions. All training was conducted at the participating facility and lasted approximately 4 hours.

SURVEY INSTRUMENTS

Three data collection instruments (see Appendix A) were developed for use by the data collectors. The Participant Consent Form (PCF) was used to introduce the study, explain the study objectives and requirements of participation, present the confidentiality procedures, and obtain consent of participant. This form was signed by the respondent, who retained a copy for her files. The original was attached to the data collection instrument and a second copy was filed in the respondent's hospital record.

The Participant Listing Form (PLF) provided a means of assigning unique numbers to participants at each performance site. The data collector completed this form as each participant was solicited; the form was returned to RTI with the completed questionnaires when work at the site was finished.

The Study Questionnaire (SQ) was the primary data collection instrument. Information concerning participant demographic characteristics, residence information, health data, use of medications, and personal characteristics was obtained through this document. The SQ was administered after patients had been screened and prior to collection of the milk sample.

PARTICIPANT SCREENING

Potential participants (lactating women) were screened by the data collector to determine whether or not they met certain study criteria, which included:

- ability and desire to provide a milk sample of approximately 100 mL.
- permanent residence within the area of interest for at least the preceding 12 months, and
- no travel outside the area of interest for the seven days preceding sample collection.

After potential participants were screened, 10 women who met all the criteria for participation were asked to provide a milk sample and complete the SQ.

PLF, PCF, AND SQ COMPLETION PROCEDURES

When an eligible person agreed to participate, her name was listed on the PLF and she was assigned a unique participant number. The data collector then read the information contained on the PCF to the participant while she followed along using a second copy. After answering questions or handling problems, the data collector asked the participant to sign the PCF prior to administration of the SQ.

The data collector then completed the SQ by asking the questions directly to the participant. Completion time averaged 15 minutes. An adhesive, computer-generated ID label was affixed to the SQ; a duplicate label was provided to be used for identifying the milk sample bottle.

Each participant was a self-respondent unless she was under 18 years of age, in which case the SQ could have been administered in whole or part to the parent or guardian, but in the participant's presence.

SAMPLE COLLECTION PROCEDURES

After completion of the SQ, the data collector made the necessary arrangements for the participant to provide the milk sample. A collection bottle was taken from the shipping box and the adhesive ID label was affixed to the bottle. The milk was manually expressed directly into the bottle; no breast pumps or other devices were allowed. Immediately after the milk was collected, the bottle was capped and the sample frozen until all ten samples were collected and ready for shipment to RTI. A minimum of 60 mL (half-full bottle) was required for each sample. If insufficient milk was collected, the sample was discarded and an additional subject was added to the study.

SHIPPING PROCEDURES

Sample bottles were packed in the shipping container, cooled with dry ice, and sent directly to RTI via Federal Express.

SECTION 6
SAMPLE ANALYSIS METHODS

The milk samples were analyzed using gas chromatography/mass spectrometry/computer. Due to the broad range of volatilities, the samples were partitioned into two general classes of compounds: volatiles (e.g. benzene, chloroform) and semivolatiles (e.g. PCNs, PCBs, pesticides). The analytical protocols developed for the volatile and semivolatile components in mother's milk are reproduced in Appendices B and C, respectively. The experiments conducted which led to these protocols are discussed below.

DEVELOPMENT OF ANALYTICAL PROTOCOL FOR VOLATILES

The headspace purge technique was validated by determining the recovery of four model compounds from raw cow's milk samples. Compounds labeled with carbon-14 were chosen in order to examine both the amounts recovered on Tenax GC and the amounts remaining in purged samples.

Twelve 50 mL cow's milk samples were spiked with methanol solutions of the ^{14}C-compounds. The analysis for each of the four model compounds was performed in triplicate. In addition, standards were prepared in triplicate by adding the appropriate amount of each compound in solution to a scintillation-counting vial containing 15 mL of Triton X/toluene/Omnifluor scintillation "cocktail." Milk samples were purged as described in Appendix B; Tenax cartridges were stored, and aliquots of the purged samples were retained for oxidation and counting.

Tenax cartridges were desorbed at 270°C and 30 mL/min N_2 for 10 minutes into 15 mL of Triton X cocktail in tandem scintillation vials. The vials were capped and refrigerated until scintillation counting. An aliquot (1 mL) of each purged milk sample was oxidized in the Packard Tricarb Sample Oxidizer, which converted all carbon-containing compounds to carbon dioxide and water. The ^{14}C-carbon dioxide was collected in a trapping solution and

referenced to a quench correction curve. All standards, Tenax samples and oxidized milk samples were counted on a Packard Liquid Scintillation Counter with automatic standardization. Counting data was analyzed by computer to obtain the number of disintegrations per minute (dpm) for each vial. The percent recovery was calculated for each milk sample as shown below:

$$\% \text{ recovery} = \frac{\text{dpm in first vial + dpm in second vial}}{\text{average dpm added to triplicate standards}} \times 100\%$$

The second of the tandem scintillation vials contained <2 percent of the radioactivity in every case. The amounts of ^{14}C compounds retained in the purged sample was calculated:

$$\% \text{ retained} = \frac{\text{dpm in oxidized, purged sample}}{\text{average dpm added to triplicate standards}} \times 100\%$$

The data are tabulated in Table 12. The recoveries for the volatile chloroform and carbon tetrachloride were about 90 percent, as expected. The less-volatile chlorobenzene and bromobenzene exhibited correspondingly poorer recoveries. These compounds are generally considered only marginally purgeable from water, so these results from milk are not surprising.

The methodology validation experiment indicated that the proposed method of analyzing human milk for volatile organic compounds was adequate. Sensitivity and detection limits were determined by the capabilities of the GC/MS/COMP system.

DEVELOPMENT OF ANALYTICAL PROTOCOL FOR SEMIVOLATILES

The extraction and cleanup method was validated using six model compounds (2,4-dichlorophenol, pentachlorobenzene, 1,2,3,4-tetrachloronaphthalene, 4,4'-dibromobiphenyl, 2,2',5,5'-tetrabromobiphenyl, and octachloronaphthalene) which were representative of the semivolatile (nonpurgeable) compounds of interest. The compounds were spiked into raw cow's milk at a level of about 1 μg/mL. Raw cow's milk was chosen as the closest readily available analog to mother's milk.

The results are presented in Table 13. The overall mean recovery was about 70 percent and the mean of the relative standard deviations was 22

Table 12. METHOD VALIDATION RECOVERY OF SELECTED VOLATILE STANDARDS FROM MILK

Compound[a]	b.p. (°C)	Percent Recovered[b]	Percent Retained[b]	Percent Accounted for[c]

[c]Six replicates.

percent. These results indicated that refinements in the method should be considered prior to a large-scale study.

Two methods were available for removing fat and other nonvolatile components of the milk extract: Florisil column chromatography and gel permeation chromatography (GPC). Evaluation of the two techniques indicated that the Florisil method was more suitable to this project. The Florisil method was faster and had greater sample capacity than the GPC. In addition, the GPC procedure required the use of a pumping system, UV detector, and expensive, fragile GPC columns. Initial tests with both methods revealed interference problems, although those with GPC were more severe. Using GPC, decabromobiphenyl and hexabromobiphenyl eluted with the fat peak. This was judged totally unsatisfactory. Using Florisil, some fat eluted in the fraction with the compounds of interest, but repetition of the procedure yielded samples sufficiently clean for analysis.

DEPARTURES FROM THE ANALYTICAL PROTOCOLS

Emulsions

The formation of an emulsion during the toluene-acetone extraction of semivolatiles (step 6, Appendix C) was an area of concern. Approximately 80 percent of the time an emulsion occurred. To eliminate this, three approaches were taken with reasonable success. The first was to avoid the emulsion formation by swirling rather than shaking the toluene and acetone extracts. The second approach was to break the emulsion by adding Na_2SO_4 and waiting. Both the amounts of Na_2SO_4 and the time required varied. In severe cases emulsions were broken by filtering through glass wool wetted with toluene.

Lipid Removal Using Florisil

Problems were also encountered during the Florisil cleanup. Some samples had a tendency to solidify while concentrating the ether/pentane eluate, apparently due to abnormally high fat content. This usually occurred when the sample volume reached 1-3 mL. The samples to which this happened were diluted with pentane and eluted through another Florisil column. The Florisil cleanup was repeated until the samples remained liquid at small (<1.0 mL) volumes. Three cleanups was the maximum required for any sample.

GC/MS ANALYSIS PROCEDURES

Samples were analyzed by gas chromatography/mass spectrometry using an LKB 2091 EI/CI GC/MS. Operating conditions for the analysis of purgeables is given in Table 14 and the operating conditions for the extractables is given in Table 15. Analysis of the purgeables involved the use of the desorption apparatus described in Appendix B.

Quantitation of the unknowns was accomplished using relative molar responses (RMRs) as discussed in Appendices B and C. The RMRs were calculated from replicate determinations of known amounts of standards and analytes.

Qualitative Analysis

Initial identification of compounds by GC/MS involved comparisons of unknown spectra with data compiled in the Eight Peak Index of Mass Spectra[67]. If the peaks present in the unknown spectra clearly matched the peaks of the standard compound in the tables and the intensities were about the same, then a positive identification was usually made. If peak intensities of unknowns varied from those of the standards, and there were isomers of the compounds that were not listed in the Eight Peak Index, then the compound was listed as an "isomer."

When the background peaks interfered with the spectrum of an unknown to an extent that made identification uncertain, the compound identification was labeled as "tentative" (tent.). If no standard spectra similar to those of the unknowns appeared in the mass spectral references, but fragments characteristic of a certain class of compounds were identified, tentative identifications were made on the basis of the characteristic fragments and apparent molecular weights. These identifications were also labeled "tent". Usually tentative identifications involved alkyl derivatives or homologs of classes of compounds that were positively identified in the same sample.

Positive identifications, as well as some tentative identifications, often required more detailed investigations of standard spectra in the Registry of Mass Spectral Data[68] or standard spectra found in other literature such as scientific journals. The Registry of Mass Spectral Data presents data in the form of histograms rather than as a list of peaks and their intensities. This type of format allowed more subtle differences in mass spectra to be considered when several similar standard spectra in the

Eight Peak Index appeared to represent possible candidates for unknown identifications.

A large number of sample components remained unidentified. These unidentified components were labeled "unknown."

In order to quantify the degree of certainty with which a compound has been identified, a "level" heirarchy has been established. The compound identification criteria are listed below:

Level I Computer Interpretation. The raw data generated from the analysis of samples are subjected to computerized deconvolution/library search. Compounds identified using this approach have the lowest level of confidence. In general Level I is reserved for only those cases where compound verification is the primary intent of the qualitative analysis.

Level II Manual Interpretation. The plotted mass spectra are manually interpreted and compared to those spectra compiled in a data compendium by a skilled interpreter. In general a minimum of five masses and intensities (±5 percent) should match between the unknown and the library spectrum. This level does not utilize any further information such as retention time since the authentic compound may not be available for establishing retention times.

Level III Manual Interpretation Plus Retention Time/Boiling Point of Compound. In addition to the effort described under Level II, the retention time of the compound is compared to the retention time that has been derived from previous chromatographic analysis. Also the boiling point of the identified component is compared to the boiling points of other compounds in the near vicinity of the one in question when a capillary coated with a nonpolar phase has been used.

Level IV Manual Interpretation Plus Retention Time of Authentic Compounds. Under this Level, the authentic compound has been chromatographed on the same capillary column using identical operating conditions and the mass spectrum of the authentic compound is compared to that of the unknown.

Level V Level IV Plus Independent Confirmation Techniques. This Level utilizes other physical methods of analysis such as GC/Fourier transform infrared spectrometry, GC/high resolution mass spectrometry, or nmr analysis. This Level constitutes the highest degree of confidence in the identification of organic compounds.

Unless otherwise stated, all identifications in this report were Level II.

SECTION 7
RESULTS

VOLATILES

All 42 of the purged samples were analyzed by thermal desorption/GC/MS. The mass spectra from selected samples were interpreted manually to determine which compounds should be quantitated. From these data, selected compounds were quantitated in all samples. All data were stored on magnetic tape for subsequent processing and are routinely archived for at least 5 years.

Qualitative Identifications

Eight samples were interpreted. The results are presented in Appendix D. Samples were selected according to the following criteria. At least two samples were required from each collection site (Jersey City and Bayonne, NJ, were counted as two separate sites). The total ion current chromatograms were inspected and the samples with the greatest number of peaks or those containing very intense unique peaks (not observed in other samples) were selected. For those samples selected, all of the mass spectra were printed and interpreted manually by experienced spectroscopists.

Table 16 summarizes the compounds found and their frequency of occurrence. It is interesting to note that some compounds (e.g. 1,1,1-trichloroethane and hydrocarbons) are common air pollutants, others (e.g., dibromochloromethane) are common water pollutants, others (dimethyldisulfide, furans, aldehydes) appear to be metabolites, others (chlorofluorocarbons, siloxanes) are known background interferents, and others (iodopentane) are of unknown source.

Quantitation

Based upon the qualitative identifications summarized above, nine compounds were selected for quantitation in all of the samples. The results for four compounds are summarized in Table 17. As discussed below, the

[f]Instrument saturated.

[g]Sample 4044 lost due to instrumental malfunction.

quantitation of the other five compounds is not reported, since the levels in milk were not judged sufficiently greater than background to be reliable.

Upon inspection, it is obvious that most values are low relative to only a few high "outliers." These high values suggest that there is a range of levels of these compounds which may correlate with exposure. These results were analyzed statistically to determine if any of the values correlated significantly. As can be seen in Table 18, the arithmetic mean and median values generally are quite different. The arithmetic mean is skewed toward the high end, generally due to one or two relatively high values. A more realistic representation of the central data is the geometric mean. These geometric mean values were tested for their significance (i.e., are the geometric means significantly different from site to site?). Table 19 summarizes this data. From this table, it appears that samples from Jersey City have significantly higher levels of chloroform, tetrachloroethylene, and dichlorobenzene than the other study samples. Charleston samples appear to have significantly higher levels of chloroform, and Bayonne samples appear to have significantly higher levels of dichlorobenzene.

To test if any of the compound levels were related, the Spearman correlation coefficients (nonparametric correlation based on the sample, designed to lessen the weight of a single high outlier) were determined as shown in Table 20. There does not appear to be any compound-to-compound correlation among the subjects.

In interpreting these data, it must be remembered that this is a very small data set. Therefore these data should not be used to extrapolate to the city or area from which the samples were collected.

Quality Control

Table 21 presents the quality control results for chloroform, tetrachloroethylene, chlorobenzene, and dichlorobenzene. The very high recovery of chloroform from the controls indicates either a miscalculation of the amount actually spiked or contamination of the samples used as controls. Since the procedural blanks contained about 15 times less chloroform, the former explanation is most reasonable. However, the chloroform values reported in Table 17 must be interpreted subject to the following

Table 18. SUMMARY STATISTICS FOR VOLATILE COMPOUNDS BY SITE[a]

[b]Arithmetic mean.

Table 19. SIGNIFICANCE OF THE DIFFERENCES IN THE GEOMETRIC MEANS BY SITE

Site	Geometric Mean (ng/mL.)			
	Chloroform	Tetrachloroethylene	Chlorobenzene	Dichlorobenzene
Bayonne	0.45	2.09	0.12	8.33
Jersey City	14.7	11.5	0.16	8.55
Pittsburgh	1.23	1.82	0.12	1.21
Baton Rouge	1.53	0.67	0.15	3.83
Charleston	5.92	1.65	0.42	1.98
Significance[a]	0.01	0.01	N.S.[b]	0.05

[a] 0.01 implies 99 percent confidence that the numbers are statistically different, while 0.05 implies 95 percent confidence.

[b] Not significant.

Table 20. SPEARMAN CORRELATION COEFFICIENTS FOR VOLATILE ORGANICS FOUND IN MOTHER'S MILK

	Chloroform	Tetrachloro-ethylene	Chlorobenzene	Dichloro-benzene
Chloroform	1.0	0.37[a]	-0.02[b]	-0.13[b]
Tetrachloro-ethylene		1.0	0.007[b]	0.05[b]
Chlorobenzene			1.0	0.03[b]
Dichloro-benzene				1.0

[a]Significant at 0.05 level (95 percent confidence).

[b] Not significant
Sample size = 42

Table 21. QUALITY CONTROL RESULTS FOR VOLATILES IN MILK

Type of Sample	Chloroform	Tetrachloroethylene	Chlorobenzene	Dichlorobenzene
Blanks[a]				
n	7	7	7	17
Mean (ng/mL)[b]	1.2	0.22	0.03	0.12
S.D.	1.3	0.11	0.025	0.19
RSD (%)	108	49	84	159
Controls[c]				
n	8	8	8	0[d]
Mean Recovery[e]	14.02[f]	1.12	0.62	-
S.D.	8.20	0.41	0.34	-
RSD (%)	58	37	55	-

[a] Blanks consisted of two field water blanks and five water blanks purged with the milk samples to monitor procedural background. No difference between the two types of blanks was observed.

[b] Arithmetic mean.

[c] Controls consisted of two spiked raw cow's milk samples carried to the field and returned, two spiked raw cow's milk samples stored in the laboratory, two spiked water samples carried to the field and returned, and two spiked water samples stored in the laboratory. No major differences were observed between the four types of samples. Samples were spiked at 30-90 ng/volume purged (or about 1 ng/mL).

[d] Not included in control spiking solution.

[e] 1.0 = 100 percent recovery.

[f] Extremely high recovery probably a result of improper loading of controls.

considerations: the mean reported levels in the samples were only 4.9 times the blank levels; the recovery from controls was about 1400 percent, invalidating the recovery study; and chloroform is known to be a laboratory atmospheric contaminant.

The compounds presented in Table 17 represented significant levels above the background in blanks. Several other compounds were quantitated that did not exhibit substantial concentrations. These compounds, with the ratio of the mean in the samples to the mean in the background given in parenthesis, were: 1,1,1-trichloroethane (1:1), benzene (2:1), toluene (2:4), trichloroethylene (1:2) and carbon tetrachloride (1:4). These levels in the samples cannot be reliably assigned to either the milk sample or to laboratory contamination. If these compounds are present in milk, they are very low and cannot be regarded as significant, given the limitations of the technique employed. Apparently, mother's milk does not represent a bioconcentration matrix for these compounds.

SEMIVOLATILES

Three samples were fully interpreted, as presented in Appendix E. As can be seen from the data, few compounds of interest were observed in the mass spectra. The data were searched on the GC/MS data system for target compounds (PCNs, PBBs and PCBs) using single ion plots called up from the full data set. No evidence for any of these compounds was observed at a detection limit of about 20 ppb. DDE was quantitated in five samples as shown in Table 22. These values were in the range generally reported by previous investigators (see Tables 2 - 4). Since none of the target compounds were present in detectable quantities, no further identification or quantitation was attempted.

Table 22. DDE AND TETRACHLOROBIPHENYL LEVELS IN SELECTED MOTHER'S MILK SAMPLES

Site	Sample Number	ng/mL Milk	
		DDE	Tetrachlorobiphenyl
Pittsburgh	2105	45	ND[b]

APPENDIX A

DATA COLLECTION INSTRUMENTS

STUDY OF ORGANIC COMPOUNDS IN HUMAN MILK

EPA Contract No. 68-01-3849

RTI Project No. 31U-1521-22

DATA COLLECTION INSTRUCTIONS

Performed for

Office of Toxic Substances

Environmental Protection Agency

Washington, DC 20460

1.0 Introduction

Under contract to the Office of Toxic Substances, Environmental Protection Agency (EPA), the Research Triangle Institute (RTI) is conducting a limited study designed to measure environmental pollutant levels in human milk and to evaluate the utility of using this body fluid in specific pollutant studies for populations in the vicinity of manufacturing plants and/or industrial user facilities. RTI is responsible for all phases of the study, including study design, subject recruitment, chemical analysis of milk samples, and report writing. RTI is a not-for-profit contract research organization located in North Carolina's Research Triangle Park between Raleigh, Durham, and Chapel Hill. The Institute was incorporated as a separate operating entity in 1958 by the University of North Carolina (UNC) at Chapel Hill, Duke University at Durham, and North Carolina State University at Raleigh, and is still closely affiliated with the three universities.

2.0 Overview

Four urban areas have been chosen as performance sites; they are Bridgeville, Pennsylvania; the area which includes Linden and Bayonne, New Jersey and western Staten Island, New York; Baton Rouge, Louisiana; and South Charleston and Nitro, West Virginia. These sites represent high-probability areas for the presence of one or more of the chemicals of interest in human milk. The selected industrial chemicals of interest include polychlorinated naphthalenes, tetrachlorethylene, trichloroethane, dichloropropane, benzene, polybrominated biphenyls, chlorinated phenols, toluene, chlorinated benzenes, and chloroform.

At each of the four sites, arrangements will be made to work through clinical facilities such as hospitals, clinics, or physician's offices, in order to recruit a panel of respondents. At each site ten participants will be recruited, for a total of 40. Potential participants (lactating females) will be screened to determine that they live in one of the areas of interest and are willing and able to provide the milk sample.

A questionnaire will be administered for each participant to obtain information on demographic variables, residence histories, and potential exposure situations; for each participant, a sample of milk will be collected and analyzed for the compounds of interest by gas chromatography/mass spectrometry or high pressure liquid chromatography. A professional member of the facility's staff, such as a registered nurse, will be trained in the proper procedures to administer the questionnaire and obtain the milk sample. To try to reduce the non-participation rate due to refusals, and to reimburse the subject for the time spent on the study, volunteers will be offered a $5.00 incentive for participating.

3.0 Data Collection

3.1 General Remarks

Data collection for this research effort consists of the following steps:

1. Screening of potential participants (lactating women) to determine that they live in one of the areas of interest (see below), that they have resided in that area for at least the preceding 12 months, that they have remained in that area continuously for the preceding week, and that they are willing and able to provide a milk sample.

2. When an eligible person is encountered, the nature and purpose of the study will be explained and their participation solicited.
3. When an eligible person agrees to participate, the person will be required to sign a Participant Consent Form (PCF) in order to participate in the study.
4. Once the participant has signed the PCF, the person should be listed on the Participant Listing Form (PLF), a Patient Number assigned, and the data collector will proceed to administer the Study Questionnaire (SQ) and collect the milk sample.
5. Once the SQ has been administered and the milk sample collected, the participant will be offered a $5.00 incentive for participating.
6. Milk samples and completed data collection instruments will be returned to RTI.

3.2 Survey Instruments

As indicated in the preceding section, there are 3 data collection instruments for this research effort, the PCF, the PLF, and the SQ; subsequent sections contain instructions for the use of each instrument as well as item-by-item explanations for their completion, and general descriptions are provided below. The survey instruments have been designed hopefully to provide an efficient means of collecting and recording the requisite data for the study. *It is imperative that all survey instruments be completed accurately.* The success and reliability of the study and its results are dependent upon the quality of data collected, which will be fully dependent

on the accuracy of your execution of your assignment. As you complete a form, conduct a thorough edit to verify that required data have been entered and entered correctly. Copies of the data collection instruments appear in Attachment 1.

3.2.1 Participant Consent Form (PCF)

- Purpose: The purposes of the PCF are to introduce the study; explain its objectives, sponsorship (the relationship and roles of RTI and EPA), and requirements of and risks, burdens, and benefits to participants; and stress that participation is completely voluntary and that all data collected will be kept confidential.
- General Description: The PCF is a single page form printed on special paper which makes three copies from a single impression. The survey title appears at the top, along with the name of RTI; spaces for necessary identifying information appear at the bottom.
- Administration: The PCF will be signed by the participant and contains an agreement to provide the necessary information and milk sample. Participants may freely withdraw from the study at any time; however, in order to encourage participation RTI offers an incentive of five dollars to each participant to be paid after each data set (PCF, SQ, and milk sample) is obtained. Again, confidentiality of data is stressed, including steps

taken to disassociate the name of the participant from the data once collected; for example, the PCF is the *only* data collection instrument which bears the name of the participant and allows its association to study identification numbers, but will be maintained in hard copy only and stored in a restricted area. To further emphasize this disassociation, the incentive will be paid in cash rather than by check or money order, although the participant will sign the PCF indicating that the incentive was received. *A signed PCF must be obtained for each participant before proceeding with Study Questionnaire (SQ) administration and collection of the milk sample.*

- Disposition: The top (white) copy will be attached to the appropriate SQ until it is received at RTI and verified; the yellow copy will be provided to the participant; the pink copy will be retained by the data collector.

3.2.2 Participant Listing Form (PLF)

- Purpose: The purpose of the PLF is to provide a means of assigning unique numbers to participants at each performance site.
- General Description: The PLF is a single page form printed on pink paper; space for Comments is provided on the reverse side. The survey title appears at the top, along with the names and addresses of RTI and EPA/OTS and a confidentiality statement.

- Administration: As each participant is enlisted up to the required number (10), that participant should be listed on the PLF.
- Disposition: When data collection at a site or facility is completed, the PLF (or a copy) should be sent to RTI.

3.2.3 Study Questionnaire (SQ)

- Purpose: The purpose of the SQ is to obtain information on participants, including demographic characteristics such as age, sex, race, and occupation; residence information; health information such as current health status and prescription medications; and personal characteristics such as hobbies.
- General Description: The SQ is divided into six sections, dealing respectively with demographic characteristics, occupation, health and personal habits, residence and household information, information on the interviewer and respondent, and information regarding the milk sample, including an indication as to whether or not the milk sample was obtained, the date and time of acquisition of the sample, and the date the sample was shipped to RTI. Participants will be identified by a unique study number used to correlate and cross-identify the questionnaires and samples by way of pre-printed self-adhesive labels. The SQ is 5 pages long, with space provided for comments.

- Administration: An SQ is to be completed for each participant for whom a signed PCF is obtained.
- Disposition: The SQ's are to be sent to RTI as instructed.

3.3 Screening

As indicated in section 3.1, potential participants (lactating women) should be screened to determine that they meet certain study criteria for participation:

1. That they are willing and able to provide a milk sample of sufficient quantity (approximately 100 ml.),
2. That they live in one of the areas of interest (see below),
3. That they have resided in that area for at least the preceding 12 months, and
4. That they have remained in that area continuously for the preceding 7 days.

As indicated in section 2.0, four areas have been chosen as performance sites, with a specific *Site Number* assigned to each which will remain constant for each site and is to be entered where appropriate on data collection instruments as follows:

Site	Site Number
Northern New Jersey/Staten Island, New York	1
Bridgeville, Pennsylvania	2
Baton Rouge, Louisiana	3
Nitro/South Charleston, West Virginia	4

With the exception of Bridgeville, Pennsylvania, participants residing in some areas at each site are of considerably more interest to the study than those living in others, as discussed in the following sections.

3.3.1 Northern New Jersey/Staten Island, New York

Within the Northern New Jersey/Staten Island area, potential participants residing in some communities are of more interest than those residing in others, more or less in the order listed below:

1. Bayonne, NJ
2. Northern Staten Island (Port Richmond), NY
3. Linden, NJ
4. Carlstadt, NJ
5. Saddle Brook, NJ
6. Jersey City, NJ
7. Kearney, NJ
8. Newark, NJ
9. Elizabeth, NJ
10. Sayreville, NJ
11. Rahway, NJ
12. Edison, NJ
13. Parlin, NJ
14. Passaic, NJ
15. Patterson, NJ
16. Wayne, NJ

3.3.2 Baton Rouge, Louisiana

Potential participants residing in Baton Rouge are of primary interest to this study; other communities in the Baton Rouge area of interest are Plaquemine, St. Gabriel, and Geismar.

3.3.3 Nitro/South Charleston, West Virginia

Potential participants residing in Nitro and South Charleston are of primary interest to this study; other communities of interest in the area are Belle and Institute.

3.4 Participant Listing Form

When an eligible person is encountered who agrees to participate, that person should be listed on a PLF in order to be assigned a unique *Participant Number*. The PLF is completed by entering the appropriate *Site Number* (see section 3.3 above); then, each time that an eligible participant is encountered who agrees to participate, up to the number required, enter the *Participant's Name (Last, First, Middle)* on the PLF and assign a *Participant Number* in the left-hand column, beginning with 0001 at each site unless other-

wise instructed. Assign Participant Numbers consecutively for all study participants. Where appropriate, enter the participant's *Medical Record Number* in the right-hand column. *When making numerical entries, right-adjust and enter leading zeros.*

3.5 Participant Consent Form

Potential participants must understand exactly what is involved in participation in the study and what benefits may be realized by participation; this understanding and agreement must be documented by a signed PCF. In the event that the potential participant is under the age of 18 years, the person's parent or other legal guardian must sign the PCF in order for the designated eligible to participate.

More specifically, the potential participant and/or that person's parent, guardian or other spokesman, must understand that full participation in the study consists of providing answers to a questionnaire related to environmental exposure, part of which relates to the individual's household in general and part of which is related to the individual participant *(be prepared to show the person the SQ)*, and providing a milk sample of approximately 100 ml. *(be prepared to show the person one of the collection bottles.)* The individual must further understand that she will only enjoy certain limited benefits in return for her time and inconvenience, primarily a $5.00 incentive to be disbursed after administration of the questionnaire and collection of the milk sample. The individual must understand that participation in the study is completely *voluntary* and that she may withdraw at any time, but that *payment of the incentive is dependent on full participation.* The individual must also understand that all data collected in the study will be held strictly confidential, and that names will not be disclosed.

If the participant or that perons's parent, guardian or other spokesman agrees to participate, read through the PCF with them and make entries where appropriate. At the bottom, record the *Date (month, day, and year)* that the PCF is signed and print the *Participant's full Name (First, Middle or Maiden, Last - do not abbreviate);* record the appropriate *Site Number* (see section 3.3 above) and *Participant Number* (from the PLF); have the participant (or other appropriate person) sign the PCF; enter your signature as witness; and record the participant's home *Address (Street Number and Name, City, State, and Zip Code)* in the spaces provided.

After data collection (administration of SQ and collection of milk sample) is completed, the participant (or that person's parent or guardian) should be given $5.00. The recipient must sign in the space provided at the bottom of the PCF to indicate receipt of the incentive. Should the signatures on the PCF for *Participant* and *Recipient* be other than the participant's, please explain in the Comments section of the SQ.

Finally, as indicated in section 3.2.1, the top (white) copy of the PCF is to be attached to the appropriate SQ; the yellow copy is to be provided to the participant or her guardian; and the pink copy is to be retained by the data collector.

3.6 Study Questionnaire

Before proceeding with administration of the SQ, *read the justification and confidentiality statement* in the box on the cover. Enter the appropriate *Site* (see section 3.3 above) *and Participant* (from the PLF) *Numbers*. Stapled inside the SQ you will find a set of pre-printed, self-adhesive labels which are necessary to identify corresponding SQs and samples. Each label contains a unique *Study Number*, which should be the same on all

labels in a set, and an indication of what the label is for. You should also have some labels that have only a Study Number and a few that are completely blank; these are for your use in the event that a label is damaged or missing. If you use a label that has a Study Number only, you will have to write on the label what it is intended for, such as *MILK;* if you use a blank label, you must write on the label the Study Number and what it is intended for. Check to be sure that all the labels in a given SQ contain the same Study Number; if not, do not use the SQ and return it to RTI. If the Study Number is the same on all labels, remove the one for the *QUESTIONNAIRE* and place it on the cover of the SQ over the spaces provided for the *Study Number*. Space for *Comments* is provided on page 5.

If the participant is under 18 years of age, the SQ may have to be administered in whole or part to the parent or guardian, and *must be administered in that person's presence*.. If the participant suffers from a speech or hearing deficit, or is otherwise incapacitated, the SQ may have to be administered to the spouse or some other spokesman.

Item 1 - Race: Indicate the participant's *race* by placing an X in the appropriate box. This question may be answered by observation; however, if there is *any doubt whatsoever,* ask.

Item 2 - Age: Determine and enter the participant's *age* in years as of the last birthday.

Item 3 - Birthdate: Determine and enter the participant's exact *birthdate* (month, day and year). Again, remember to right-adjust and enter leading zeros. *A note on dates: accept and record partial dates, if that is all that the respondent can provide;* in that case, indicate missing elements of the date

with a dash (-) -- for example, April 1977 would be recorded as [0][4] - [-][-] - [7][7] .

Item 4 - Weight: Determine and enter the participant's approximate weight in *pounds (to the nearest pound--no fractions!) or kilograms*, in which case observe the decimal.

Item 5 - Height: Determine and enter the participant's approximate height in *inches or centimeters*.

Item 6 - Current Employment: Determine if the participant is currently employed in any capacity and place an X in the appropriate box. If the answer is Yes, continue to Item 7; if the answer is No, skip to Item 10.

Item 7 - Length of Present Employment: Determine and record the length of time that the participant has been employed by her present employer; enter the units in the spaces provided and then place an X in the appropriate box to indicate whether the units represent days, months, or years.

Item 8 - Occupation Away From Home: Determine if the participant's occupation *usually* takes her away from home and place an X in the appropriate box. If Yes, continue to Item 9; if No, skip to Item 11. This question, and Item 9 below, are aimed at eliciting information regarding the location of the participant's various exposure to the environment.

Item 9 - Location of Present Employment: If the participant is currently employed, determine the nature (not the name) and location (street address, city, state, and Zip Code, if known)

of the employer. By *nature*, we mean the type of business, such as service station, school, hospital, grocery store, doctor's office, hotel, restaurant, etc.

Item 10 - Employment Status: If the participant is not presently employed, determine which of the provided categories best describes the participant's status and place an X in the appropriate box. If the response is choice 1 or 2, skip to Item 15; if the response is choice 3-5, continue to Item 11.

Item 11 - Usual Occupation: Determine and record the participant's *usual (or most common)* occupation *(when employed);* be succinct - e.g., high school coach, waitress, hotel desk clerk, taxi driver.

Item 12 - Present Occupation: Determine if the participant is presently employed in her usual occupation (indicated in Item 11) and place an X in the appropriate box. Items 12 and 13 may be skipped for unemployed, retired and disabled persons.

Item 13: If the response to Item 12 was positive, determine how long the participant *has been* employed in her usual occupation (recorded in Item 11) and record; enter the units in the spaces provided and then place an X in the appropriate box to indicate whether the units represent days, months or years.

Item 14: Determine if the participant presently works at or in any of the listed occupations or establishments and place an X in each appropriate box.

Item 15 - Present Smoking Status: Ascertain if the participant currently smokes *cigarettes*, and place an X in the appropriate box. If YES, continue to Item 16; if NO, skip to Item 18.

Item 16 - Age at First Smoke: If the participant is a smoker (a positive response to Item 15), ascertain the age (in years) at which the participant started smoking and record in the spaces provided.

Item 17 - Smoking Frequency: Ascertain how many cigarettes the participant smokes *per day, on the average,* and place an X in the appropriate box. *If the participant uses tobacco in some form other than cigarettes, such as snuff, record in the space provided.*

Item 18 - Time Outdoors: Ascertain the *average number of hours* that the participant spends *out of doors each day* and record in the spaces provided -- another indication of environmental exposure.

Item 19 - Time Away From Home: Determine how many hours of the day *on the average* the participant normally spends more than 2 miles away from home, and record in the spaces provided. This determination should be done separately for *weekdays* and *weekends*.

Item 20 - General Health Status: Using the four qualifiers provided, ascertain the participant's general current health status and place an X in the appropriate box.

Item 21 - Prescription Medications: Inquire as to whether the participant is currently taking any *prescription medication(s)* on a regular daily basis and place an X in the appropriate box; if YES, determine and record the *drug name* - e.g., penicillin, oral contraceptives, Valium, phenobarbital, etc.

Item 22 - Non-prescription Medications: Inquire as to whether the participant has taken any *non-prescription medications* in the past 24 hours, and place an X in the appropriate box; If YES, determine and record the *drug name* -e.g., aspirin, vitamins, Dristan, Bufferin, Alka-Seltzer, etc.

Item 23 - Gasoline: Inquire as to whether the participant pumps her own gasoline, for example at *self-service* pumps, and place and X in the appropriate box.

Item 24 - Egg Consumption: Determine and record the approximate number of *eggs* that the participant has eaten in the past 48 hours. Again, in recording numerical entries, remember to right-adjust and enter leading zeros.

Item 25 - Hobbies: Determine if the participant pursues any of the listed avocations and place an X in each appropriate box.

Item 26: Determine if the participant pursues *any* activity that includes *regular* use of solvent glue or model airplane cement, and place an X in the appropriate box.

Item 27 - Length of Residence in Area: Determine how many years the participant has lived in the *area of interest*, and record in the spaces provided. Round to the nearest year, except that if the response is less than one year record as [< | 1] and terminate the interview; the individual is ineligible to participate further in the study. This situation should be detected during the screening process.

Item 28 - Length of Residence at Current Address: Determine how long the participant has lived at her *current address;* record the units in the spaces provided and place an X in the appropriate box to indicated whether the units represent days, months, or years. Use the most appropriate units and round to the nearest appropriate unit. For example, more than 28 days should be expressed in months and more than 11 months should be expressed in years. If the participant has resided at her current address for less than 12 months, but has lived in the area of interest for at least 12 months, record any previous addresses during the preceding 12 months (city and state is sufficient) in the Comments section.

Item 29 - Cooling Appliances: Determine whether any of the indicated appliances or others, in which case *specify,* are used to cool the participant's home and place an X in the appropriate box(es) for *all that apply.*

Item 30 - Home Garden: Determine if the participant's household consumes food grown in a home garden and indicate the response by placing an X in the appropriate box. If a positive response is obtained, determine the *location* of the garden and record. Location could be *participant's backyard,* or another community, in which case specify city and state; be as specific as possible.

Item 31 - Commercial Food Source: Determine where the participant's household *usually* obtains fruit and/or vegetables and record.

Again, be as specific as possible. For example, if the city or town has more than one store by the same name, the store name alone would not be an adequate answer; as a matter of course, record the name and location of the store, market, or vendor.

Items 32-34 - Water Sources: In Item 32, try to determine the *primary* source of *drinking water* for the participant's household and place an X in the appropriate box. In Item 33, determine if the *same* primary drinking water source indicated in Item 32 is used for *drink mixes* such as coffee and tea; if it differs, indicate how. In Item 24, try to determine the primary source of *water for cooking* in the participant's household and place an X in the appropriate box. For example, some households in some areas of the country use *bottled water* for drinking and drink mixes but *tap water* (from whatever source) in cooking.

Item 35 - Other Household Tobacco Use: Inquire as to whether *other members* of the participant's household smoke, and place an X in *the* appropriate box; if YES, determine if the other members smoke cigarettes, cigars, a pipe, etc. and place an X in *each* appropriate box.

Item 36 - Occupation of Other Household Members: Determine if any other members of the participant's household work at any of the listed occupations or businesses, and place an X in each appropriate box.

Item 37 - Hobbies of Other Household Members: Determine if any other members of the participant's household pursue any of the listed avocations, and place an X in each appropriate box.

Respondent/Interviewer Information

Item 38 - Respondent: Indicate, by placing an X in the appropriate box, whether the person who served as the *primary respondent* was the participant or some other person, in which case *specify* in the space provided.

Item 39 - Interviewer Number: Enter your assigned 3-digit *Interviewer* identification *Number*.

Item 40 - Date of Interview: Enter the date (month, day and year) that the interview was conducted and the questionnaire completed.

Item 41 - Interviewer Name: The name of the person administering the questionnaire should be printed in the space provided.

Sample Information

Item 42: Indicate, by placing an X in the appropriate box, whether or not a milk sample was collected; if not, explain in the Comments section below.

Item 43 - Date and Time of Milk Sample Collection: If a milk sample is collected, record the *date (month, day and year)* and approximate *time (using a 24-hour clock)* of such collection. The time should correspond to the time that collection was completed; on a 24-hour clock, add 12 to the p.m. hours - e.g., 1:00 p.m. would be 13:00, 5:30 would be 17:30, etc.

Item 44 - Date Shipped to RTI: Record the date (month, day and year) that the respective milk sample was shipped to RTI, or turned over to an RTI representative.

3.7 Collection of the Milk Sample

3.7.1 General Remarks

As indicated in section 1.0 above, the milk samples are being collected for chemical analysis by RTI as part of an EPA study to measure pollutant levels in human milk and evaluate the utility of using this body fluid in specific pollutant studies. The chemical compounds for which the samples will be analyzed are present in extremely low levels, so the utmost care and cleanliness must be used to prevent either contamination or loss. The instructions below are designed to preserve the integrity of the sample and should be followed precisely.

3.7.2 Sample Collection Instructions

1. The bottles provided have been thoroughly cleaned and should be kept tightly closed, except during sampling; do not wash or otherwise clean them.
2. Remove the *MILK SAMPLE* label from the sheet of labels in the appropriate SQ and place on one of the collection bottles.
3. The milk should be *manually* expressed directly into the the bottle; do not use breast pumps or other devices as the plastics in such devices would contaminate the sample. Hands should be cleaned and thoroughly rinsed to remove any residual soap; do not use rubber gloves.

4. Collect as much milk as possible. Unless the mother has recently nursed her infant, at least half a bottle should be easily obtainable. Less than half a bottle is unuseable and does not constitute a sample. The ability of the participant to provide an adequate sample should be determined during the screening process.
5. Immediately cap the bottle and double check to see that the study numbers on the bottle and questionnaire match.
6. The milk sample should be immediately frozen following collection and remain so until shipping.
7. Note any deviations from this procedure in the Comments section of the appropriate SQ.

3.7.3 Shipping Instructions

1. Pack the container as it was received.
2. Fill the can with *dry ice*.
3. Make sure that there is adequate padding to prevent breakage, that all excess space is filled with packing material.
4. Fill out enclosed Federal Express forms, attach to the outside of the box, and seal the box.
5. Call Federal Express and have them pick up the package.
6. When Federal Express picks up the package, call Dr. Mitch Erickson at RTI (see below) to notify him that Federal Express has picked up the package; if Dr. Erickson is out, leave an appropriate message with his secretary.

7. Mail the corresponding questionnaires to RTI in one of the envelopes provided.
8. When the questionnaires are in the mail, call Ben Harris at RTI (see below) to notify him that the questionnaires are in the mail; if Mr. Harris is out, leave an appropriate message with his secretary.

4.0 Confidentiality

All survey research conducted by RTI is based on highest ethical standards, including those related to confidentiality. These standards are applied from the earliest steps of deciding whether or not RTI should participate in a proposed survey to the final steps of analyzing and reporting the information obtained. Strict precautions must be observed at all times to protect the rights of those whom we interview or about whom we collect data. Such precautions are built into the study design, so that promises of confidentiality and anonymity will be upheld during all phases of data handling and analysis.

No amount of effort to insure confidentiality will be successful, however, unless those responsible for data collection in the field maintain equally rigid standards, treating with utmost confidence all information offered *or observed* during data collection. Successful and meaningful survey research is dependent on the establishment of trust between individuals engaged in data collection and sources of information, and maintaining this sense of responsibility to the public throughout all survey activities.

Each data collector will be required to sign in duplicate a contractual agreement which includes provisions on confidential treatment of data. This agreement is designed to protect you as well as RTI and participating institutions and individuals. A copy of this agreement appears in Attachment 2.

The importance of total confidentiality cannot be over-emphasized. Any breach of confidence could result in litigation.

5.0 Contacts with Project Staff

During the data collection period it will be necessary for data collectors to maintain regular contact with RTI project staff by telephone. While you are collecting data, problems or confusing issues may arise that are not addressed in these instructions. You are encouraged to telephone RTI whenever you experience a problem or encounter a situation which you feel you cannot adequately handle.

All supplies required for data collection will be furnished by RTI. Should you require additional supplies during the conduct of data collection, inform your RTI contact so that proper arrangements can be made. Need for additional supplies should be anticipated so that your work will not be delayed while you await receipt of needed items. All study-related items that are in your possession at the conclusion of data collection are to be returned to RTI or disposed of according to instructions from your RTI contact.

Calls to RTI should be made between the hours of 8:30 a.m. and 5:00 p.m. (Eastern Time), Monday through Friday, to RTI's toll-free number, 800-334-8571. Request to speak to the appropriate project staff member listed below:

Dr. Mitch Erickson — Extension 6505
(regarding milk sample collection)

Mr. Ben Harris — Extension 6055
(regarding participant selection and questionnaire administration)

If the problem is particularly acute, and you have trouble getting through on the toll-free line, call *collect* 919-541-6505 (Dr. Erickson) or 919-541-6055 (Mr. Harris). After 6:00 p.m. Eastern Time you may call Mr. Harris *collect* at work (919-541-6055) or person-to-person at home (919-942-6988).

RESEARCH TRIANGLE INSTITUTE
STUDY OF ORGANIC COMPOUNDS IN HUMAN MILK

PARTICIPANT CONSENT FORM

I understand that Research Triangle Institute is engaged in a study of various organic compounds as they appear in human milk. I understand that the survey is being conducted in order to measure the levels of various organic compounds in human milk, and is limited to the purpose stated. I further understand that the survey is being conducted under the auspices of the United States Environmental Protection Agency in cooperation with

_____ [Name of Local Agency] _____

I do hereby freely consent to participate in this study of organic compounds in human milk and understand that my participation will consist of providing answers to a questionnaire related to environmental exposure and providing a milk sample of approximately 100 ml. I understand that an agent of Research Triangle Institute will administer the questionnaire and collect the milk sample, after which I will receive an incentive of five dollars for my participation.

I understand that my name will not be voluntarily disclosed, or referred to in any way when compiling and evaluating the results of the study. I understand that participation in this study may result in no direct benefits to me, other than those described herein, and that I am free to withdraw from this study at any time. It has been explained to me that there are no significant risks to me from participation in this study. I further understand that while participating in the study I will be free to ask any questions concerning the study; if I have any further questions about the project, I know that I am free to contact

_____ telephone number _____

or Mr. Benjamin S. H. Harris, III, Survey Operations Center, Research Triangle Institute, Research Triangle Park, North Carolina 27709, telephone number 919-541-6055.

QUESTIONNAIRE

THE RESEARCH TRIANGLE INSTITUTE OF RESEARCH TRIANGLE PARK, NORTH CAROLINA, IS UNDERTAKING A RESEARCH STUDY FOR THE U.S. ENVIRONMENTAL PROTECTION AGENCY OF LEVELS OF VARIOUS ORGANIC COMPOUNDS IN HUMAN MILK. THE INFORMATION RECORDED IN THIS QUESTIONNAIRE WILL BE HELD IN STRICT CONFIDENCE AND WILL BE USED SOLELY FOR RESEARCH INTO THE EFFECTS OF ENVIRONMENTAL FACTORS ON PUBLIC HEALTH. ALL RESULTS WILL BE SUMMARIZED FOR GROUPS OF PEOPLE; NO INFORMATION ABOUT INDIVIDUAL PERSONS WILL BE RELEASED WITHOUT THE CONSENT OF THE INDIVIDUAL. THIS QUESTIONNAIRE IS AUTHORIZED BY LAW (P.L. 94-469). WHILE YOU ARE NOT REQUIRED TO RESPOND, YOUR COOPERATION IS NEEDED TO MAKE THE RESULTS OF THIS SURVEY COMPREHENSIVE, ACCURATE, AND TIMELY.

Study number: ☐☐☐☐☐☐ Site number: ☐ Participant number: ☐☐

First, I would like to ask some general questions about you.

1. Race: [1] Hispanic [2] American Indian/Alaskan Native [3] Black, not of Hispanic origin [4] Asian/Pacific Islander [5] White, not of Hispanic origin [6] Other (Specify) _____

2. What was your age in years at last birthday? [ ][ ] Years

3. What is your birthdate?
(Month) [ ][ ] - (Day) [ ][ ] - (Year) [ ][ ]

4. What is your approximate weight?
[ ][ ][ ] lbs. [ ][ ][ ] kgs.

5. What is your height? [ ][ ] inches [ ][ ][ ] cms.

Next, I would like to ask some questions about your occupation.

6. Are you presently employed in any capacity? [1] Yes (Continue) [2] No (Go to Q. 10)

7. How long have you been employed by your present employer? [ ][ ] Units [1] Days [2] Months [3] Years

8. Does your occupation usually take you away from home? [1] Yes (Continue) [2] No (Go to Q. 11)

9. What is the nature and location (street address) of the company for which you work?
(Specify) _____ [ ][ ][ ][ ][ ] (Zip Code)

10. If not presently employed, which of the following best describes your status?
[1] Housewife, [2] Student (Go to Q. 15)
[3] Unemployed, [4] Retired, [5] Disabled (Continue)

11. What is/was your usual occupation? (Specify) _____

12. Are you presently employed in this occupation? [1] Yes [2] No

13. If yes to above question, how long have you been employed in that occupation?
(Questions 12 and 13 may be skipped for unemployed, retired, and disabled persons.) [ ][ ] Units [1] Days [2] Months [3] Years

14. Do you work at or in any of the following occupations or establishments? (Check all that apply.)
[1] Painting [3] Chemical plant [5] Service station/garage/engine repair
[2] Dry cleaning [4] Petroleum plant [6] Furniture refinishing or repair

Next, I would like to ask some questions regarding your health and personal habits.

15. Do you smoke? [1] Yes *(Continue)* [2] No *(Go to Q. 19)*

16. How old were you when you first started smoking? [ ][ ] Years

17. On the average, how many cigarettes do you smoke per day?

[1] Less than ½ pack (1-4 cigarettes) [4] About 1½ packs (25-34 cigarettes)

[2] About ½ pack (5-14 cigarettes) [5] About 2 packs (35-49 cigarettes)

[3] About 1 pack (15-24 cigarettes) [6] More than 2 packs (50 or more cigarettes)

NOTE: *If the participant uses tobacco in some other form (other than cigarettes—e.g., snuff), record here:* _____

18. What is the average number of hours that you spend out of doors each day? [ ][ ] Hours

19. How many hours of the day, on the average, do you normally spend away from home? *(Average separately for weekdays and weekends).*

Weekdays [ ][ ] Hours Weekends [ ][ ] Hours

20. What do you consider the current status of your health? *(Check one.)*

[1] Excellent [2] Good [3] Fair [4] Poor

21. Are you currently taking any prescription medication(s) on a regular daily basis? [1] Yes [2] No

If yes, specify: _____

22. Have you taken any non-prescription medications in the past 48 hours? [1] Yes [2] No

If yes, specify: _____

23. Do you pump your own gas? [1] Yes [2] No

24. How many eggs have you eaten in the past 48 hours? [ ][ ]

25. Do you pursue any of the following hobbies? *(Check all that apply.)*

[1] Furniture refinishing [2] Painting [3] Scale models [4] Gardening

26. Do you pursue any activity that includes regular use of solvent glue or model airplane cement?

[1] Yes [2] No

Lastly, I would like to ask some questions about your residence and household.

27. How many years have you lived in this area? [ ][ ] Years

28. How long have you lived at your current address? [ ][ ] Units [1] Days [2] Months [3] Years

29. Do you cool your home with any of the following appliances? *(Check all that apply.)*

[1] Central air conditioning [4] Window fan(s) [7] None of these
[2] Window air conditioner(s) [5] Ceiling exhaust fan(s) [8] Do not know
[3] Evaporative cooler(s) [6] Circulating fan(s) [9] Other *(Specify)* _____

30. Does your household grow any of its own food in a home garden? [1] Yes [2] No [3] Do not know

If yes, specify location of garden _____

31. Where does your household obtain fresh fruit and/or vegetables? *(Specify)* _____

32. What is the primary source of your water for drinking?

[1] Bottled water [3] Tap - community well [5] Tap - cistern
[2] Tap - municipal supply [4] Tap - private well [6] Do not know
[7] Other *(Specify)* _____

33. Is that the same primary source of water for drink mixes such as coffee, tea, Kool-Aid, etc?

[1] Yes [2] No If no, how does it differ? *(Specify)* _____

34. What is the primary source of your water for cooking?

[1] Bottled water [3] Tap - community well [5] Tap - cistern
[2] Tap - municipal supply [4] Tap - private well [6] Do not know
[7] Other *(Specify)* _____

35. Does anyone else in your household smoke? [1] Yes [2] No [3] Do not know

If yes, check all that apply: [1] Cigarettes [2] Cigars [3] Pipe [4] Other *(Specify)* _____

36. Does anyone else in your household work at any of the following occupations/businesses? *(Check all that apply.)*

[1] Painting [3] Chemical plant [5] Service station/garage/engine repair
[2] Dry cleaning [4] Petroleum plant [6] Furniture refinishing or repair

37. Does anyone else in your household pursue any of the following hobbies? *(Check all that apply.)*

[1] Painting [2] Furniture refinishing [3] Scale models [4] Gardening

---

RESPONDENT/INTERVIEWER INFORMATION

38. Respondent: [1] Participant [2] Other *(Specify)* _____

39. Interviewer number: [ ][ ][ ] 40. Date of interview: *(Month)* [ ][ ] - *(Day)* [ ][ ] - *(Year)* [ ][ ]

41. Interviewer name: _____

SAMPLE INFORMATION

42. Was a milk sample collected? [1] Yes [2] No

43. If yes, date (Month) [ ][ ] - (Day) [ ][ ] - (Year) [ ][ ] and time Hours : Minutes [ ][ ] : [ ][ ]

44. Date shipped to RTI: (Month) [ ][ ] - (Day) [ ][ ] - (Year) [ ][ ]

Research Triangle Institute
Data Collection Agreement

Research Triangle Institute DATA COLLECTION AGREEMENT	For Project _____ _____ Project No. _____

I, _____, agree to provide, as an employee of Powerforce Company, Inc., field data collection services for Research Triangle Institute in connection with the project named above.

a. I agree to provide services within the guidelines and specifications for project data collection activities provided by Research Triangle Institute;

b. I am aware that the research being conducted by the Institute is being performed under contractual arrangement with _____ _____;

c. I agree to treat as <u>confidential</u> all information secured during interviews or obtained in any project-related way during the period I am providing services to the Institute;

d. I shall at all times recognize and protect the confidentiality of all information secured while providing my services throughout the conduct of this research project;

e. I am aware that the survey instruments completed form the basis from which all the analysis will be drawn, and therefore agree that all work for which I submit invoices will be of high quality and in accordance with project specifications; and

f. I fully agree to conduct myself at all times in a manner that will obtain the respect and confidence of all individuals from whom data will be collected and I will not betray this confidence by divulging information obtained to anyone other than authorized representatives of Research Triangle Institute.

APPENDIX B

SAMPLING AND ANALYSIS OF VOLATILE ORGANICS IN MILK

SAMPLING AND ANALYSIS OF VOLATILE ORGANICS IN MILK

1.0 Principle of the Method

Volatile compounds are recovered from an aqueous or solid sample by warming the sample and purging helium over it. The vapors are then trapped on a Tenax cartridge which can be introduced by thermal desorption directly into the GC/MS for analysis. This protocol is the result of extensive development efforts.[1-9]

2.0 Range and Sensitivity

For a typical organic compound approximately 30 ng is required to obtain mass spectral identification using high resolution gas capillary GC/MS analysis. Based on a 50 g milk sample, a detection limit of about 0.6 µg/kg would be possible. The dynamic range (limit of detection to saturation on the mass spectrometer) for a purged sample is $\sim 10^4$; however, smaller samples may be purged and the upper end of the range increased commensurately.

3.0 Interferences

Two possible types of interferences must be considered: (1) material present in the sample which physically prevents the effective purge of the sample, and (2) material which interferes with the analysis of the purged sample. In the former case, several techniques have been developed to handle such problems (e.g., foaming) by diluting and stirring the sample. The second case is minimized by the use of GC/MS for the analysis, since unique combinations of m/z and retention time can be selected for most compounds. This permits the evaluation of compounds even though chromatographic resolution is not obtained.

4.0 Precision and Accuracy

The purge and trap technique has been evaluated for a variety of matrices using model compounds which are expected to be typical of volatile halogenated compounds.[1]

The recovery of the purge step was validated using cow's milk samples spiked with ^{14}C-chloroform, ^{14}C-carbon tetrachloride, ^{14}C-chlorobenzene and ^{14}C-bromobenzene. The average recoveries were 88, 88, 63, and 35 percent, respectively. The recoveries correlate roughly with volatility (inversely with boiling point), so anticipated recovery for other compounds may be interpolated from these data.

5.0 Apparatus

5.1 Purge Apparatus

The purge apparatus is shown in Figure 1.

5.2 Sampling Cartridges

The sampling tubes are prepared by packing a 10-cm long x 1.5-cm i.d. glass tube containing 6 cm of 35/60 mesh Tenax GC with glass wool in the ends to provide support.[2,3] Virgin Tenax is extracted in a Soxhlet extractor for a minimum of 24 h with redistilled methanol and pentane prior to preparation of cartridge samples.[2,3] After purification of the Tenax GC sorbent and drying in a vacuum oven at 100°C for 2-3 h all of the sorbent material is meshed to provide a 35/60 mesh-size range. Sample cartridges are then prepared and conditioned at 270°C with helium flow at 30 mL/min for 30 minutes. The conditioned cartridges are transferred to Kimax® (2.5 cm x 150 cm) culture tubes, immediately sealed using Teflon-lined caps, and cooled. This procedure is performed in order to avoid recontamination of the sorbent bed.[2,3]

5.3 GC/MS/COMP

The volatile halogenated hydrocarbons purged from water are analyzed on either an LKB 2091 GC/MS with an LKB 2031 data system or a Varian MAT CH-7 GC/MS with a Varian 620/i data system. The sample, concentrated on a Tenax GC cartridge, is thermally desorbed using an inlet manifold system.[2,4] The operating conditions for the thermal desorption unit and the analysis Tenax GC cartridges are given in Table 1.

6.0 Materials

6.1 Sampling

Clean, 120 mL, wide-mouth glass bottles with Teflon-lined caps are used for the collection of milk samples.

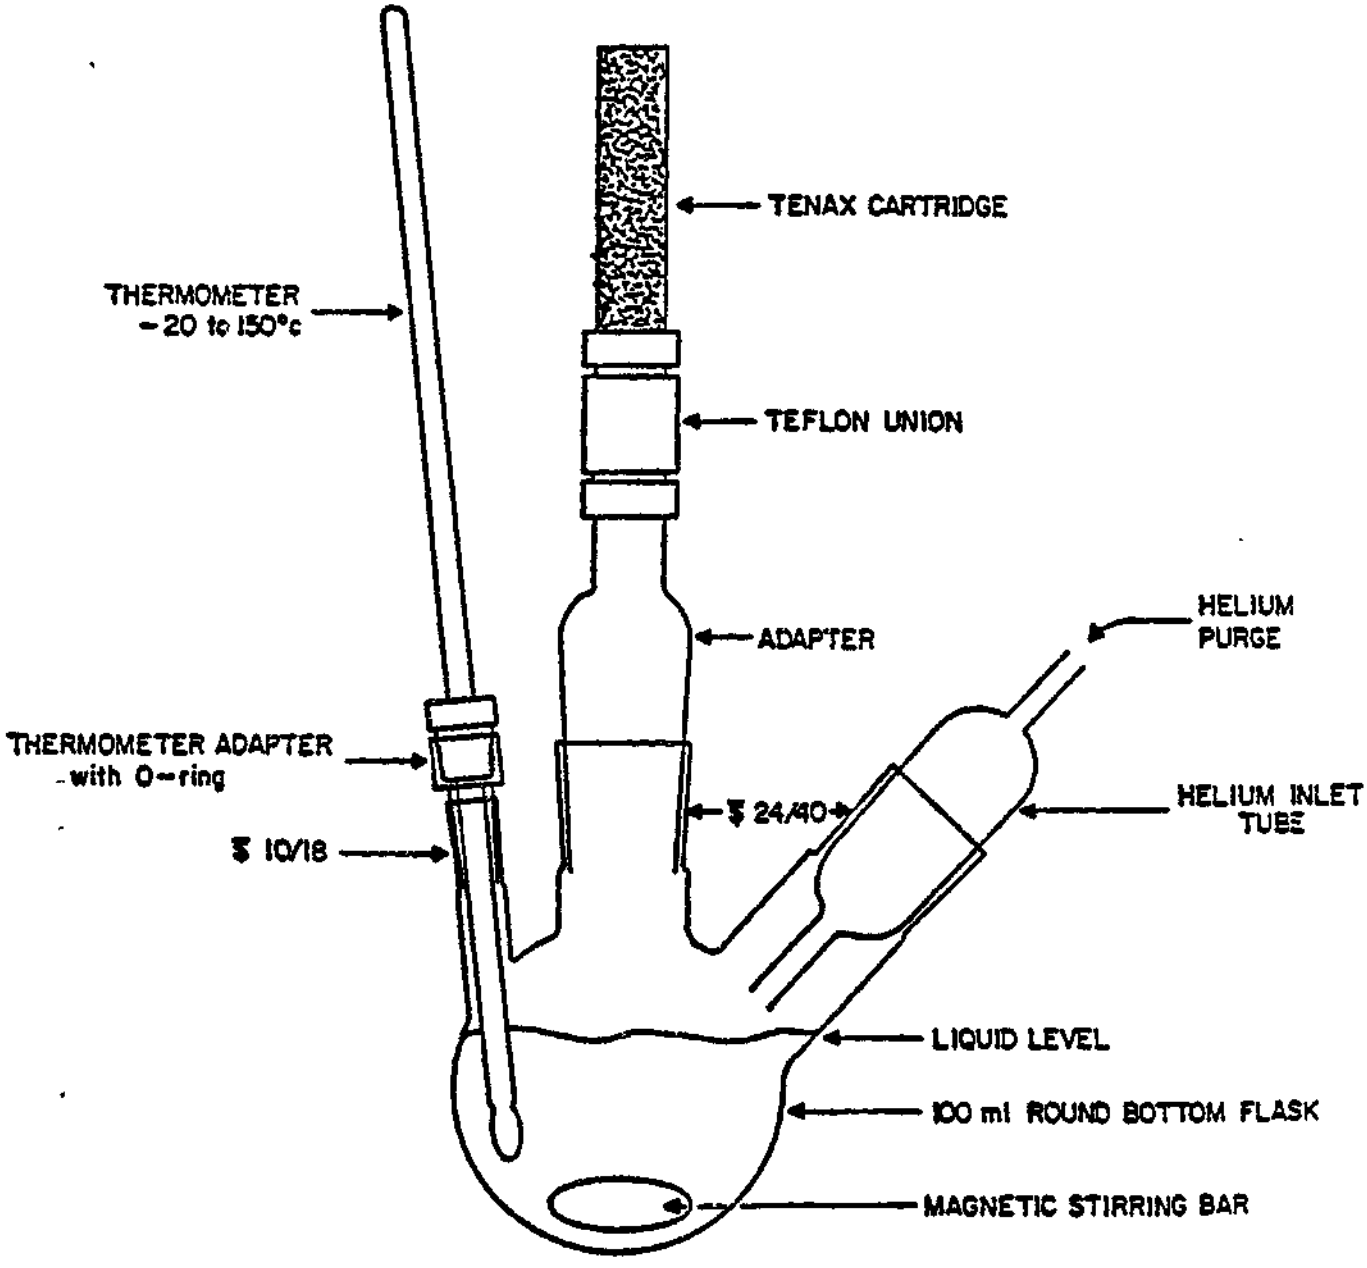

Figure B-1. Diagram of headspace purge and trap system.

Table B-1. INSTRUMENTAL OPERATING CONDITIONS

	LKB 2091	Varian MAT CH-7
Desorption chamber temperature	270	265
Desorption chamber He flow	15 mL/min	10 ml/min
Desorption time	8.0 min	8.0 min
Capillary trap temperature during desorption	-196°C	-196°C
Temperature of capillary trap during injection onto column	-196°C to 250°C - then held at 190°C	
Time of He flow through capillary trap	12 3/4 min	12 3/4 min
He flow through column [sweep time]	9.5 min	4 min
Carrier flow	2.0 mL/min	1.0 ml/min
Capillary column	100 m SE-30 SCOT	20 m SE-30 WCOT
Column temperature	30°C for 2 min, then 4°/min to 240°	20 → 240° at 4°/min
Scan range	5-490 dalton	20 → 500 dalton
Scan rate	2 sec full scale	1 sec/decade
Scan cycle time	2.4 sec	4.5 sec
Scan mode	parabolic	exponential
Trap current	4A	
Filament current	50μA	300μA
Accelerating voltage	3.5 kV	2kV

6.2 Purge

Tenax cartridges - 16-mm o.d. x 10.5 cm glass tubes filled with 6 cm of Tenax with 1-cm glass-wool plugs in each end.

Charcoal cartridges - 16-mm o.d. x 6 cm filled with 4 cm of charcoal and glass-wool plugs in each end.

Glass culture tubes with Teflon-lined screw caps.

7.0 Procedure

7.1 Collection of Field Samples

Milk (60-120 mL) is expressed directly into the wide-mouth bottle, capped tightly, and frozen for shipment and storage. To preserve the integrity with respect to volatiles, handling and transfer must be minimized.

7.2 Purging of Volatiles

The apparatus is assembled as depicted in Figure 1, including the Tenax GC cartridges (1.5-cm diameter x 6.0-cm length). A carbon cartridge 1.5-cm diameter x 4.0-cm length is connected to the effluent end of the Tenax cartridge to prevent contamination of the cartridge by laboratory vapors. The milk sample is cooled to ~4°C, shaken vigorously and 100 mL diluted with 350 mL distilled water. The pH of the solution is adjusted to 4.0 with sulfuric acid. A glass-wool plug is inserted into the center neck of the flask just above the level of the solution and, with the flask in a heating mantle, the solution is heated to 70°C while it is stirred with a magnetic stirrer. The sample is purged at 15 mL helium/min and 70°C for 90 minutes. The loaded cartridge is removed and stored in a culture tube containing 1-2 g $CaSO_4$ desiccant for 2-12 h. The desiccant is removed from the culture tube and the dry, loaded cartridge stored at -20°C.

7.3 Analysis of Sample Purged on Cartridge

The instrumental conditions for the analysis of volatile compounds of the sorbent Tenax GC sampling cartridge are shown in Table 1.[2-9] The thermal desorption chamber and six-port valve are maintained at 270°C and 200°C, respectively. The helium purge gas through the desorption chamber is adjusted to 15-20 mL/min. The nickel capillary trap at the inlet manifold is cooled with liquid nitrogen. In a typical thermal desorption cycle a sampling cartridge is placed in the preheated desorption chamber and helium gas is channeled through the cartridge to purge the vapors into the liquid

nitrogen cooled nickel capillary trap. After desorption the six-port valve is rotated and the temperature on the capillary loop is rapidly raised; the carrier gas then introduces the vapors onto the high resolution GC column. The glass capillary column is temperature programmed from 20°C to 240°C at 4°/min and held at the upper limit for a minimum of 10 minutes. After all of the components have eluted from the capillary column, the analytical column is cooled to ambient temperature and the next sample is processed.

7.4 Quantitation

All data are acquired in the full scan mode. Quantitation of the halogenated compounds of interest is accomplished by utilizing selected ion plots (SIPs), which are plots of the intensity of specific ions (obtained from full scan data) versus time. Using SIPs of ions characteristic of a given compound in conjunction with retention times permits quantitation of components of overlapping peaks. Two external standards, perfluorobenzene and perfluorotoluene, were added to each Tenax GC cartridge in known quantities just prior to analysis. In order to eliminate the need to construct complete calibration curves for each compound quantitated, the method of relative molar response (RMR) is used. In this method the relationship of the RMR of the unknown to the RMR of the standard is determined as follows:

$$RMR_{std} = \frac{A_{unk}/moles_{unk}}{A_{std}/moles_{std}}$$

$$RMR_{unk/std} = \frac{A_{unk}/g_{unk}/GMW_{unk}}{A_{std}/g_{std}/GMW_{std}}$$

where A = peak response of a selected ion,
std = standard
unk = unknown
g = number of grams present, and
GMW = gram molecular weight.

Thus, in the sample analyzed:

$$g_{unk} = \frac{(A_{unk})(GMW_{unk})(g_{std})}{(A_{std})(GMW_{std})(RMR_{unk/std})}$$

The value of an RMR is determined from at least three independent analyses of standards of accurately known concentration prepared using a gas permeation system.[3] The precision of this method has been determined to be generally ±10 percent when replicate sampling cartridges are examined.

APPENDIX C

ANALYSIS OF SEMIVOLATILE ORGANIC COMPOUNDS IN MILK

ANALYSIS OF SEMIVOLATILE ORGANIC COMPOUNDS IN MILK

1.0 Principle of the Method

Milk samples are collected from nursing mothers and frozen until ready for analysis. An aliquot of the thawed sample is then extracted, cleaned up by Florisil column chromatography and analyzed by GC/MS/COMP.

The extraction procedure used here is preferable to that used by the AOAC[1], since both polar and nonpolar compounds are extracted from the milk. The AOAC method is designed for pesticide residues and would not efficiently extract polar and/or acidic compounds.

Open column chromatography is a necessary prerequisite to GC/MS/COMP analysis. Although some loss of sample may occur during the extraction and cleanup, these procedures remove proteins and fats from the sample which would otherwise create overwhelming interferences for GC/MS/COMP analysis.

Since the compounds of interest in these fractions cover such a broad range of volatilities, the GC/MS/COMP analysis can be rather complex. The higher PBBs of interest in the extracted fraction must be chromatographed on a very short column (45 cm x 0.2-cm i.d., 2 percent OV-101 on Gas-Chrom Q) at high temperatures to elute them as sharp peaks which may be identified and quantitated. These chromatographic conditions are not applicable to more volatile compounds since they are not resolved from the solvent. Thus, the extracted fraction is analyzed a second time using a nonpolar SCOT capillary column (either OV-101 or SE-30 liquid phase) to separate and identify semivolatile constituents (e.g. chlorobenzenes, PCNs, pesticides, etc.). The chromatographic conditions are typically 60°C initially, programmed to 240°C (or the column limit) at 6°/min.

The mass spectral data are stored on magnetic tape. The mass spectra of interest will be printed out by the instrument operator for qualitative analysis. Quantitation from this data may be achieved by integrating the area of selected ions and comparing them to the area of the external standard.

The sensitivity of the determination may be significantly improved for quantitative purposes by using the technique of selected ion monitoring (SIM), also known as multiple ion detection (MID). This technique monitors up to 9 ions at a sensitivity 10-100 greater than the normal operating mode. This technique is used for quantitation of compounds in samples where the increased sensitivity is necessary for detection or accurate determination.

2.0 Range and Sensitivity

The detection limit of the GC/MS/COMP system has been determined to be about 5-50 ng/μL for pesticides such as γ-BHC, p,p'-DDE, atrazine, trifluralin and heptachlor using a 40 m SE-30 capillary column. When SIM was used, the detection limit was about one order of magnitude less (i.e., 0.5-5 ng/μL). The detection limit for tetrabromobiphenyl is about 1 ng/μL in the SIM mode using 45 x 0.2-cm i.d. column packed with 2 percent OV-101 coated on Gas-Chrom Q.

For an instrumental detection limit of 1 ng/μL, the overall sensitivity of the method should be about 6 ng/mL (6 ppb) milk assuming a 50 mL milk sample extracted and extract concentrated to 0.3 mL. This detection limit may be improved by using SIM and may be worsened by background interferences.

3.0 Precision and Accuracy

When electron capture gas chromatography (GC/ECD) was used, the mean recoveries from cow's milk for seven replicates ranged from 57 to 93 percent for six model compounds. Thus, the results obtained may be as little as half the actual amount in the sample. The relative standard deviations (RSD) for the above replicates ranged from 11 to 33 percent, with the average RSD at 21.7 percent. Thus the precision of the method is about ± 20 percent. It is anticipated that accuracy and precision will improve with experience with the method.

4.0 Apparatus

4.1 Gas Chromatograph

A Fisher-Victoreen 4400 gas chromatograph with an ^{3}H electron capture detector, a 10^{-13} AFS electrometer, and a 1.0 mV recorder is used.

4.2 Gas Chromatography Column

For most compounds, separation is achieved using a 40 m SCOT glass capillary column coated with 1 percent SE-30 and 0.32 percent Tullanox. For

the compounds of very low volatility (e.g. the higher PBBs) which will not chromatograph on the capillary column, a 45- x 0.2-cm i.d. glass column packed with 2 percent OV-101 on Gas-Chrom Q is used.

4.3 Liquid Chromatography Column

A 24-mm i.d. glass column with a Teflon stopcock is used.

4.4 Gas Chromatography/Mass Spectrometer

An LKB 2091 gas chromatograph/mass spectrometer with 2 PDP 11/4 computer is used. The system is equipped with a glass jet separator and is used with either glass capillary or packed glass column.

5.0 Materials

Kuderna-Danish evaporators:

- 5 mL receivers
- 250 mL KD flasks
- Snyder columns
- 500 mL flat-bottom boiling flasks

250 mL separatory funnels

Clean glass wool

Whatman 1 P/S filter paper

Florisil

Sodium sulfate (anhydrous)

Acetone "Distilled in Glass", redistilled

Pentane "Distilled in Glass", redistilled

Toluene "Distilled in Glass", redistilled

Ethyl ether "Distilled in Glass"

6.0 Procedure

6.1 Extraction

(1) Mix 50 mL (or volume available up to 50 mL) of a milk sample with clean glass wool and 150 mL of acetone to precipitate the proteins.

(2) Decant and filter the acetone/water layer.

(3) Repeat steps 1 and 2 with two 50 mL acetone fractions.

(4) Concentrate to about 20 mL using a Kuderna-Danish evaporator.

(5) Extract the precipitate with 40 mL of toluene; decant and filter the toluene layer.

(6) Combine the toluene extract and the acetone extract with shaking.

(7) Let the layers separate and draw off toluene (top) layer.

(8) Repeat Steps 5-7 with 40 mL toluene and then with 10-20 mL toluene.

(9) Discard the lower water layer.

(10) Dry the organic layer with anhydrous sodium sulfate and concentrate to desired volume using a flat-bottom boiling flask and Snyder column. Quantatively transfer to a vial and concentrate to 5-10 mL under a gentle stream of nitrogen.

6.2 Florisil Column Chromatography[1]

(1) Prepare Florisil by heating to 130°C for at least 5 hours.

(2) Prepare a 24-mm i.d. column so that the Florisil is 10 cm high after settling.

(3) Place about 1 cm of anhydrous sodium sulfate on top of the Florisil.

(4) Rinse column with 40-50 mL pentane, never allowing the solvent to go below the Na_2SO_4 layer, as channeling may result.

(5) Add up to 10 mL of sample to column.

(6) Elute with 200 mL of 6 percent ethyl ether/pentane solution at $\leq$5 mL/min.

(7) Collect and concentrate in a Kuderna-Danish evaporator.

(8) Evaporate under nitrogen stream to $\sim$ 1.5 mL. Quantitatively transfer to a vial, store in a freezer.

(9) If sample solidifies after concentration, repeat the Florisil cleanup (Steps 1-8).

6.3 Standards

Standards are spiked into the sample following the extraction and workup (d_{10}-pyrene was used at 200 ng/mL).

6.4 Analysis

6.4.1 GC/MS/COMP Analysis for Semivolatiles

Inject 0.2 µL onto a 40 m SE-30 SCOT capillary at 60°C initially, program at 6°/min to 240°C, then hold until no more peaks are observed. Collect mass spectral data at 2 sec/scan from m/z 20-500. Compounds amenable to this analysis include organic compounds with volatility lower than that for purgeable compounds. Only the very low volatile compounds (e.g. higher PBBs) will not elute from the capillary.

6.4.2 GC/MS/COMP Analysis for Low Volatile Compounds

6.4.2.1 Normal Procedure

Inject 1.0 μL onto a 45 x 0.2-cm i.d. glass column packed with 2 percent OV-101 on GasChrom Q at 220°C initially, program to 300° at 12°/min and hold until all peaks have eluted. A helium flow rate of 20 mL/min is used. The mass spectrometer is scanned from m/z 20-1000 at 2 sec/scan.

6.4.2.2 Alternate Procedure

Using the same chromatographic conditions analyze the sample by SIM. Preselect up to 8 ions characteristic of the compound(s) of interest and one ion characteristic of the standard. Retention times provide qualitative identifications. Peak areas may be used for quantification as discussed below. This alternate procedure has 10-100 times better sensitivity than the full scan mode and provides faster quantitative results. The main disadvantage is that only preselected compounds may be identified.

In addition, if specific halogenated compounds are found to be present with little interference in most samples, they may be analyzed by GC/ECD. This procedure improves the sensitivity and reduces the analysis time (since GC/MS/COMP requires an offline data output). If GC/ECD is used, approximately 10 percent of the analyses are verified by GC/MS/COMP.

6.4.3 Qualitative Data Interpretation

Spectra are interpreted by visual comparison with standard spectral reference collections[2,3] where possible. Where standard spectra are not available, tentative identifications are made based upon interpretation of the mass spectrum. Where possible, the GC retention time is also used to assist in the identification procedure.

All identifications and interpretations are checked independently by other experienced chemists or spectroscopists to assure that the interpretations are correct.

6.4.4 Quantitative Analysis

In order to eliminate the need to construct complete calibration curves for each compound to be quantified, the method of relative molar response (RMR) is used. Successful use of this method requires information on the exact amount of standard added and the relationship of RMR (unknown) to the RMR (standards). In general, the RMR for a compound is determined for a

characteristic ion (parent or fragment) in its mass spectrum. The integrated ion current may also be used, but is generally less precise. The value of RMR is determined from at least three independent analyses. The method of calculation is as follows:

$$(1)\quad RMR_{unknown/standard} = \frac{A_{unk}/moles_{unk}}{A_{std}/moles_{std}}$$

A = peak area, determined by integration or triangulation of the total ion current or for a selected mass of each compound

$$(2)\quad RMR_{unk/std} = \frac{A_{unk}/g_{unk}/GMW_{unk}}{A_{std}/g_{std}/GMW_{std}}$$

A = peak area, as above
g = number of grams present
GMW = gram molecular weight

Thus, in the sample analyzed:

$$(3)\quad g_{unk} = \frac{A_{unk}/GMW_{unk}/g_{std}}{A_{std}/GMW_{std}/RMR_{unk/std}}$$

APPENDIX D

VOLATILE COMPOUNDS IDENTIFIED IN SELECTED PURGES OF MOTHER'S MILK

Table D-1. VOLATILE COMPOUNDS IDENTIFIED IN PURGE OF SAMPLE NO. 1081 (Bayonne, NJ)

Chromatographic Peak No.	Elution Temp. (°C)	Compound
1A	58	carbon dioxide
1B	58	chlorotrifluoromethane
2	61	propylene
3	65	C_4H_8 isomer
4	66	C_4H_{10} isomer
5	67	C_4H_8 isomer
6	73	acetaldehyde
7A	73	acetone
7B	74	trichlorofluoromethane
8	76	n-pentane
9	77	isopropanol
10	79	methylene chloride
11	80	freon 113
12	83	carbon disulfide
13	93	n-butanal
14	87	cyclopentane
15	89	$C_4H_6O_2$ isomer
16	91	methyl ethyl ketone
17	92	C_6H_{12} isomer
18	94	hexafluorobenzene (int. std.)
19	95	n-hexane
20	96	chloroform
21	97	C_7H_{14} isomer
22	99	C_6H_{12} isomer
23A	102	perfluorotoluene (int. std.)
23B	102	methylcyclopentane
24	104	1,1,1-trichloroethane
25	105	C_7H_{14} isomer
26	108	benzene
27	112	cyclohexane
28A	113	ethyl vinyl ketone
28B	114	2-pentanone
29	115	$C_6H_{12}O$ (tent.)
30	116	n-pentanal
31A	119	trichloroethylene
31B	119	C_7H_{12} or C_6H_8O isomer
32	122	n-heptane
33	126	C_8H_{16} isomer
34	129	C_7H_{14} isomer
35	134	1-chloropentane
36	135	unknown
37	138	toluene
38	143	$C_6H_{12}O$ isomer (tent.)
39	145	n-hexanal
40	147	C_8H_{16} isomer
41	150	n-octane

UNITED STATES DEPARTMENT OF COMMERCE
National Technical Information Service
5285 Port Royal Road
Springfield, Virginia 22161
OFFICE OF THE DIRECTOR

NEW NTIS ABSTRACT NEWSLETTERS !

Dear Professional:

I wish I could tell you how much time and money the NTIS Abstract Newsletters could save you.

But, I can't. Because I don't know how much time and money you unknowingly spend on costly research that actually duplicates the work of others. Yet this research information is readily available to you when you know how to access it.

That's what NTIS Abstract Newsletters are all about.

NTIS Abstract Newsletters Summarize
70,000 New Reports Annually

You see, NTIS information specialists index, analyze, and categorize 70,000 new research documents a year. Each report is judged for its potential value for thousands of current subscribers. Then it is summarized in a brief abstract and published in one or more Newsletters. You receive only those abstracts of interest to your professional field.

NTIS exists to help you find--and provide you with--research results and information. You'll know what you need to know--when you need to know it--with NTIS Abstract Newsletters.

The Newsletters are a speedy, comprehensive, economical way for you to keep current on the latest research and to cut your risk of duplicating work already available in a report from NTIS.

Your Newsletters will suggest possible directions and starting points for your own research. Knowing research applications of others will help you get more out of every research dollar you invest.

Worldwide Sources

The NTIS collection also contains selected information on scientific and technical developments around the world.

NTIS is now actively expanding its sources of foreign technology to add to more than 300,000 foreign reports already on hand--including translated materials from the U.S.S.R., other Eastern European countries, Japan, and major Western countries.

Low Subscription Rate

> By now, you may well be apprehensive over the cost of this remarkable Newsletter service. If so, you will be pleasantly surprised to learn you can subscribe to the *Energy Abstract Newsletter*, for example, for about $1.83 a week!

NTIS is a unique self-supporting Government agency offering economical information products and services on a cost-recovery basis.

You Get Reports on Research Not Published By Any Other Source

NTIS Abstract Newsletters let you know about all Government-sponsored research in your field. Each week you'll learn about research not reported or available from any other source.

And when you spot a report you need, NTIS can provide it for you in a matter of days, usually for about $14 in paper copy or only $4.50 in microfiche. Your Newsletters contain a handy report order form for your convenience.

Annual Subject Index Included

Your subscription includes an Annual Subject Index to give permanent reference value to your Newsletter.

* U.S. GOVERNMENT PRINTING OFFICE: 1983 - 381-009 227/524

Of course, your subscription is tax deductible as a business expense in most instances.

More than that, when you consider the wasted time and costly mistakes the Newsletters can help you avoid, you will begin to appreciate what a practical investment NTIS Abstract Newsletters really are. For example:

- *MANUFACTURING TECHNOLOGY:* one of the newest Newsletters that meets industry's most pressing need right now...brings news of the latest research on robotics and CAD/CAM. $125*

- *FOREIGN TECHNOLOGY:* abstracts of latest technological and scientific research in all fields from Japan, United Kingdom, France, U.S.S.R., and countries all over the world. SPECIAL CHARTER RATE: $75*

- *ENVIRONMENTAL POLLUTION & CONTROL:* one of the most sought after Newsletters covering air, noise, solid wastes, water, pesticides, radiation, health and safety and environmental impact statements. $95*

- *ENERGY:* brings you a wealth of information on energy use; supply and demand; power and heat generation; energy policies, regulations and studies; engines and fuels, and much more. $95*

- *COMPUTERS, CONTROL, AND INFORMATION THEORY:* important information, and lots of it, concerning this, one of the fastest growing and most competitive industries worldwide. $95*

- *MATERIAL SCIENCES:* applicable to nearly every industry with abstracts touching on a huge variety of processes and products. $80*

- *MEDICINE & BIOLOGY:* covers an enormous range of information from anatomy to zoology. Every facet of medicine and biology is touched upon. $75*

And any one of the abstracts in these Newsletters may be the added element of success for your ongoing research, contract proposals, cost reduction efforts, and profits.

NTIS regularly publishes information not available elsewhere, and frequently brings you news of research before it appears in professional journals and magazines. You simply should not risk acting without benefit of complete, current information on what's happening in Government-sponsored research in your field.

*One-year subscription rate

(Over, please)

You need NTIS Abstract Newsletters and here's how to order them.

Complete the order form at the bottom of this letter and mail it back today to the address below. You may use any of the options listed in order to pay for your subscription.

You are guaranteed satisfaction. If your Newsletters do not satisfy you for any reason, you may cancel and receive a credit or refund for the balance of your subscriptions.

I invite you to subscribe today.

Sincerely,

Joseph F. Caponio
Acting Director
